

July 7, 1970

TO:

PDP-10 Customers

FROM:

David Stone

Supervisor - PDP-10 Monitor Development

SUBJECT: The 5.01 Monitor for the PDP-10

This document explains the contents of the software kit accompanying the release of 5.01. Read it first to guide you to an understanding of the rest of the material.

Sincerely,

David L. Stone

MDFINT

MDFREF

SCHED (now two routines; SCHED1 and SWPSER)

2. A GUIDE TO THE 5.01 DOCUMENTATION

2.1 Existing Documentation.

Except in the area of the disk service, the 5.01 monitor conforms to the same documentation as the previous release (4S72) as modified by the published Monitor Change Orders (MCO's). The definitive document is the PDP-10 Software Notebook which is updated at least quarterly. Other documents which pertain are the PDP-10 Reference Handbook and the newly published PDP-10 Timesharing Handbook. These are modified by the MCO's which are included in this release.

2.2 New Documentation.

2.2.1 Level D.MEM

This memorandum is the best introduction to the new Level D disk service. It is divided into four sections -- each explaining the disk service from a different point of view. The operator,

the console user, the programmer and the system manager are all given an introduction to the details which are more fully described in DSKØ16.MEM.

2.2.2 DSKØ16.MEM

DSKØ16.MEM is the definitive detailed description of the Level D disk service. It should be read by all systems programmers and system managers. Since it is an older document, some changes have occurred. These are described in LEVELD.MEM.

2.2.3 MONITR.OPR

This document contains complete instructions for building and operating the 5.01 monitor. It is extremely valuable to system operators and managers.

2.2.4 TABLE.TXT

TABLE.TXT is a table of contents for the magnetic tape which contains the 5.01 release. It divides the release into sections which correspond to the DEC-tapes on which they are kept at Maynard. Each module is briefly identified by a line of text.

2.2.5 MONSUP.MAN

This document is a supplement to the other documentation and contains information about 5.01 which is not directly related to the disk file system -- e.g. the DC10E handler and the TMPCOR feature.

2.2.6 DOC'S, MEM'S and MAN'S.

On the release tape are many files with extension DOC, MEM and MAN. These files are the original documentation for the monitor support cusps supplied on the tape. In section .1.3 of this letter, references to "tape 10" mean that the cusp in question (say FILEX) is documented by an ascii file named FILEX.MEM to be found in the DEC-tape 10 section of the release.

2.2.7 FLO'S.

The three files in the release with extension FLO are "english flow-charts" of the internal workings of three major portions of the Level D disk service. They are intended to give insight into the algorithms used by the programs but are not at this time completely accurate. However, as a guide to the system programmer they are still valuable, though not as definitive as the listings.

2.2.8 PATCHES

Fixes to the monitor made after 5.01 was frozen are documented in the patch release included in the software kit.

3. A FEW WORDS ABOUT THE LEVEL D DISK SERVICE

The Level D Disk Service included in the 5.01 release is extremely complex and very efficient. It has a large number of options and parameters which can be used to tailor it to a specific configuration. However, since there are so many hardware and software options, it is inevitable that some combinations are never tested together. The standard answers for the once-once dialogue are given in LevelD.MEM. The answers given there have all been tested. Hardware configurations tested have included RM10B drums, RD10 fixed head disks, RP01 disk packs (up to 4) and RP02 disk packs (up to 3). Dual RP10 controllers have been used to drive both RP01 and RP02 disks simultaneously. Both file and swapping storage have been put on all of the above devices, singly and in combination. In short, we have tested a large number of options but have left some out.

As a result of the complexity of the options available, Soft-ware Trouble Reports for the disk service will have to include a great deal of pertinent information in order to be serviced. Anomalies of hardware configuration, file structures and software parameters will have to be spelled out explicitly where pertinent.

4. 5.01 RELIABILITY

The 5.01 monitor has been running in some form at Maynard on our development PDP-10 since March of 1970. We have subjected

the monitor to two kinds of stringent testing in addition to the usual unit and integrated tests made for any project. First, we have created a program to generate jobs which perform actions according to directions in an ascii file (for details see SCRIPT.MEM on Tape 12). Using this program to generate job loads as high as 64 users (on an 80K configuration) we have exhaustively tested the various areas which typically cause trouble with monitors — limit conditions expecially. We have scripts which fill up and fragment the swapping space, load the IO channels, exhaust the available disk space, etc. These scripts, when run simultaneously, cause the monitor algorithms considerable anguish. However, the 5.01 monitor has been taught to live comfortably with them.

Another application of the SCRIPT program has been to generate job loads which closely approximate the user job loads which we see in-house on our production machine and on other machines run by our customers. These scripts, which use all the standard language processors and cusps, also run the line printer and tape drives to simulate an actual user environment. They have been very helpful in debugging the 5.01 release.

Most important of our reliability tools, however, has been our production time-sharing PDP-10. This machine has a user population which typically varies from 28 to 36 during prime shift (8:30 a.m. to 6:00 p.m.), from 15 to 20 during the second shift (6:00 p.m. to 12:00 p.m.) and from 0 to 10 during weekends. These three different intensities of use give us a good evaluation of the reliability of our monitor under different loads. The configuration of the machine is 80K of 1.8 µs memory, one RM10B for swapping on its own DF-10, 3 RPO2 disk drives on another DF-10, 3 magnetic tape drives, 8 DECtape drives and a line printer. It handles up to 40 simultaneous users -- primarily on hardwired TTY's but with up to eight remote TTY's. The reasonable response job limit for this configuration is about 30-34 jobs. Most of the users are systems programmers and therefore are capable of putting more strain on the system than most users.

During most of the month of June, precursors to 5.01 have been running on the production machine. Reliability has proven to be roughly linear with load. During the two weeks preceding the writing of this letter, the crash rate on that machine has been:

	Week l	Week 2
1st. shift 2nd. shift Weekends	<pre>1 crash/shift 1/2 crash/shift No Crashes</pre>	NO CRASHES

During this period, the number of users who can be accommodated with reasonable response has increased over Level C by about 5 - or roughly 20%.

5. EFFICIENCY AND THROUGHPUT MEASUREMENT

5.1 WATCH.

A new feature has been added to the 5.01 monitor to allow the user to observe the service he is getting and the efficiency of his programs. The WATCH command allows each user to have a printout of the time of day at the beginning of each command which uses user core and at the end, a printout of the elapsed real time and cpu time, plus the number of disk reads and writes (in blocks) for his program. Any or all of these printouts may be requested. Once turned on, they continue until another Watch command is given. The default printouts are The monitor set table at assembly time and patchable. is distributed with the default set to no printout. WATCH H for a list of the parameter names. See MCO's for a detailed description.

5.2 Level D versus Level C.

Some measurement of the efficiency of Level D versus Level C has been made. While any such tests are bound by a large number of parameters (exact placement on the disk, buffer size, competition from other users), a few general comments apply.

For a sequentially accessed file stored in contiguous blocks on a disk pack, Level C will require a full latency between adjacent blocks if they are requested by two separate input UUO's. Since Level C allows no parallel operations on other disks, the entire system is slowed down by the loss of latency. The maximum throughput for a single block requested at a time (assuming the drive to be always on track) is one block per 27.5 milliseconds. Level D, on the other hand, will not miss the latency if the input request is made in time.

The more disk drives, controllers and channels you have, the more efficient Level D will be over Level C because of parallel seeks and data transfers. With four RP02's on one controller and one channel, if a random track request for a single block is always queued up for each drive, the Level C throughput is one block every 65 ms

or 15.4 blocks per second. The Level D throughput is one block every 15 ms or 67 blocks per second.

On a user benchmark involving a loop of fortran overlays, Level D took less than one-third the real time required by Level C on the same equipment. More comprehensive measurements of Level D's efficiency are under way and will be reported later.

6. SOME NEW PROGRAMS

6.1 Crash Procedures.

To speed up the operation of a computer, the 5.01 release contains two new support cusps which facilitate loading a new monitor, dumping a dead monitor and dealing with the dump; they are BOOTS and FILEX. Both these programs have their own documentation files on DECtape image 10. BOOTS should be kept on a paper tape for loading into the machine after a crash. It will save the remains in "CRASH.SAV" and reload the system from "SYSTEM.SAV". FILEX will expand the CRASH.SAV file into input suitable for FILDDT to analyze.

6.2 SCRIPT and SCP's.

Included in the 5.01 release are the SCRIPT program (mentioned above) and a number of files with extension SCP. These latter are the ascii input to SCRIPT and consist of several of our test programs. We have included them as potentially helpful examples of SCRIPT input.

6.3 FRM's.

Files with extension FRM are examples of the forms which we use at Maynard to report software errors and fixes. They are included because some of our customers indicated that they would be useful.

6.4 DSKC and Friends.

The files DSKC, DSKCØ, DSKCl and DSKC2 are simple DDT programs to print the number of free blocks remaining on a file structure. They are interim programs to help out until the "LEFT" command is implemented. DSKC prints out the total number of blocks left on logical structure DSKC. Similarly, DSKCØ -1 and -2 print the number of

free blocks left on units \emptyset , 1 and 2 of logical structure DSKC. By suitable use of the ASSIGN command (.ASSIGN DSKB DSKC) any file structure can be investigated.

6.5 Others.

For descriptions of other new programs see section 1.3 of this letter for the place in which they are documented.

7. DOCUMENTATION CHANGES

7.1 Protection.

The 5.01 file protection scheme is almost completely compatible with Level C. The correct description is given in Level D.MEM Version 2 dated May 27, 1970 on page 27. DSK016.MEM has an incorrect description. The default protection has been set to 057 rather than 055 at the request of our service bureau customers. This means that files in one project cannot be read by another project. To change the default, set the symbol PRVFIL to your choice at MONGEN time.

7.2 LOOKUP, ENTER, RENAME.

- 7.2.1 Error code #6 may now include BADUFD.
- 7.2.2 Note that four word LOOKUP'S are still legal.

 They are distinguished by a non-zero left half of word one.

7.2.3 Rename.

A deficiency in 5.01 is the inability to rename a file and transfer it to a different UFD. It must be copied separately.

7.3 USETO.

When USETO is set past the end of a file, zeroes are written in the file at that time, not later at output time.

7.4 Read Image Mode.

Contrary to DSKØ16.MEM section 2.1, read image mode is not implemented in either hardware or software.

7.5 CRASH.SAV.

A new once only question asks the size of CRASH.SAV on each file structure. This file is for use with BOOTS (see section 6.1 of this letter) and need not be given any room if BOOTS is not to be used.

7.6 ALCDSK vs ALCFIL.

The cusp described as ALCDSK in DSKØ16.MEM is now named ALCFIL.

7.7 FILE command.

There has been an option switch change in FILE. "D" which formerly meant "DIRECTORY" now means delete.
"L" is the new switch for DIRECTORY LISTING.

8. DEFAULT CHANGES

8.1 SYS Protection

When files are copied into SYS, the operator should explicitly set the file protection with PIP or FILEX to 155. Otherwise the standard protection of Ø57 will be substituted thereby preventing access by most of the users. FAILSAFE and FAILCD automatically restore files explicitly to their original protection.

8.2 Tape Density.

Default tape density has been set to 800 BPI.

8.3 Memory Speed.

The default memory speed for shuffle time computations has been set to 1 microsecond.

9. RANDOM INFORMATION OF INTEREST

- 9.1 The DIRECTORY command now requires a colon (":") after the device name.
- 9.2 There may be a difference between the number of blocks allocated to a user (printed by LOGOUT) and the number

written (printed by DIRECTORY) if the cluster size is is not one.

- 9.3 If you want to look at other people's files on UFD'S you must explicitly specify any file structures which they have access to which are not on your search list.

 The DIRECTORY command will only print files on structures in your search list.
- 9.4 For a file with protection 455, the owner cannot write or delete. He must rename to a lower protection first. 455 is the protection used by Level C LOGOUT to indicate a "preserved" file.

At our installation, many of our more knowledgeable users rename all their files with PIP to have protection 4XX to speed up LOGOUT. If they choose to do this under Level D, they should make the protection be 1XX rather than 4XX.

- 9.5 LOGOUT when confirming deletion of individual files requires a K and will not accept just a carriage return.
- 9.6 The number of core blocks used by the monitor is settable at once-only time. Patch symbol CORNUM; each block is worth 4 words.
- 9.7 If once-only gets a hardware error it puts the controller CONI status in the lights.
- 9.8 For faster Failsafe operation after refreshing a file structure, use the "/N" switch to prevent LOOKUP'S.
- 9.9 FTHALT is 1 for this release.

10. IMPLICATIONS OF SOUP

Be sure to keep an inviolate copy of all original sources in this release as a "father" for SOUP updates in the future. We hope to make most future releases with SOUP.

11. 10/40 N and 10/40 D MONITOR

The sources for 5.01 will not produce a 10/40 N or 10/40 D monitor. Some undefined globals occur. This will be rectified in the future with SOUP updates.

12. HOW TO GET ON THE AIR WITH A MAGTAPE DISTRIBUTION

Since you received your monitor distribution on magnetic tape, you will need to read MONITR.OPR sections 1 and 2 and LEVELD.MEM sections 4.2 in order to make a 5 series monitor for your configuration. The magnetic tape contains all of the monitor sources in a Level C FAILSAFE format in project-programmer number 10,7. Thus old customers who already have a disk system, may read the magnetic tape with a Level C FAILSAFE onto their Level C disk system. New customers will receive a monitor already built for their hardware configuration on a DECtape labeled "YOUR MONITOR" (Tape #1). They must read MONITR.OPR section 1 and LEVELD.MEM section 12 in order to start running their system.

symp: Undefined symbol in DPCREF when assembled for 10/40
 disk system.

diag: DPCIOC under FTSWAP conditional.

cure: Remove from conditional.

DPCREF

MCO 780

symp: If monitor assembled with FTHALT=-1 monitor halts
 whenever user has an ILM.

diag: The check in APRINT for PI's in progress must not include the APR PI level itself.

cure: Define a symbol in common (APRNOT) which is all PI's levels except APR for CONSZ PI.

CLOCK1 p. 19 COMMON

MCO 781

symp: Monitor halted in CHKTAL routine with negative CORTAL. Sharable high data segment (write lock off) is destroyed, and then appears to occupy 256K of core.

diag: The sharable high data segment had become idle and got deleted from core under the false assumption that a copy existed on the swapping space (not true for non-write-locked segments).

cure: The FRECR1 routine in SEGCON must be made to recognize this case and cause the segment to be swapped out.

However, CORTAL must remain unchanged by this operation.

SCHED p. 43, 46 SEGCON p. 42, 59, 61, 64

MCO 782

symp: FILDDT restricted to searching 48K.

diag: Arbitrary limit imposed in routines SETUP and FETCH.

cure: Remove the limitation.
DELETE FETCH+6/ CAIL R,301

FETCH+7/ POPJ P.

- diag: ERRPNT called with high segment # in ITEM and bits set in left half.
- cure: Replace segment number with associated job # before calling ERRPNT.

SCHED p. 41

SEGCON p. 60

symp: Parity recovery code is not used (intentional).

diag: 4S74 was distributed with the code purposefully included but never called so that it could be debugged later and small patches sent.

CLOCKI p. 16

MCO 794

symp: Random locations may be clobbered if operator continues after a parity error halt (i.e. PC was in exec mode or more than one parity error in user mode).

diag: On a parity error halt, the monitor must not attempt to fix up the bad word if parity error did not occur out of the sweep loop.

cure: Check PC on parity error from exec mode. If not in sweep loop, don't try to fix bad word.

CLOCK1 p. 17

MCO 795

symp: Mem parity error message does not print absolute address correctly.

diag: TAC1 instead of TAC was being set up to call OCTPNT.

cure: Set up TAC with absolute address.

ERRCON p. 1, 16, 16-1

MCO 798

symp: High segment MACRO.SHR didn't get marked for later deletion from segment table when MACRO.SHR renamed to MACRO.OLD.

diag: DSKSER now changes filename and extension in DDB after a RENAME so FNDSEG never found correct high segment when it existed.

cure: Call FNDSEG before RENAME and call CLRNM1 after successful RENAME if shared segment being RENAMED.

UUOCON p. 41

SEGCON p. 68, 72

NULSEG P. 17

symo: PAKLOD doesn't work on RPØ2's.

diag: Test for which kind of drive is wrong.

cure: Move 2 bits. (2 other trivial changes)

PAKLOD b. 2, 4, 10

MCO 802

symp: Monitor halts in APRINT with PI in progress on APR channel and some lower priority channel.

diag: Out-of-bounds transfer address for user enabled trans leads to loop on APR channel until a lower priority interrupt occurs.

cure: Treat interrupt occurring at trap instruction fetch as though user not enabled for that error and give an error message.

In addition, more code was added to cope with the situation of an ILM that appears to be in EXEC mode, but really only did a JSR on the lower priority interrupt level. This is treated as though ILM occurred directly and lower channel is given a legal address to dismiss to.

CLOCK1 p. 16, 18, 19

SPECIFICATION CHANGE MCO 805

symp: Can't determine what's a card punch (needed by Fortran).

diag: Can share CDR/CDP with DVCDR, since one is input and one
 is output.

cure: Set DVCDR in CDPDDB.

CDPSER p. 1

MCO 806

symp: MONGEN asks for dev:file specification for CONFIG but ignores extension even if supplied.

diag: No code to check for user supplied file extension.

cure: Add code.

MONGEN p. 3

symp: FILDDT output showed undefined symbols that should have been defined.

diag: Final part of monitor symbol table lost because EOF encountered.

cure: Remove test for EOF but zero window contents before reading.

FILDDT

MCO 811

symp: Push down list overflow at channel 7 level.

diag: Decoding RUN command at clock level which required deleting a fragmented high segment.

cure: Increase size of NULPDL.

CLOCK1 p. 21, 22 COMMON p. 21, 23

SPECIFICATION CHANGE

MCO 815

symp: User requests that CDPSER ignore RUB-OUTs in ASCII mode.

diag: Seems like a good idea.

cure: CAIN TAC,177 JRST NOPUN

CDPSER p. 19

SPECIFICATION CHANGE

MCO 817

symp: User desires error return on OUT UUO when gets EOT on MAGTAPE.

diag: Sounds like a winning change.

cure: Change UUOCON exit from OUT UUO to also look for EOT bit.

UUOCON p. 62

MCO 821

diag: Not enough monitor CORE for DISK DEVICE DATA BLOCKS, particularly when running COBOL jobs which have 8 open files.

cure: Increase standard size of MINCOR.

COMMON

MCO 824

symp: MCO #791 has introduced an error such that files get garbled on transfer from DECtape or block too large error received.

diag: Storing dead-reckoning block # in DTASRN rather than DDB, but DTASRN switches disconnected tapes. Therefore the number must be in DDB.

cure: Store in LH of DLOC (previously unused).

DTASRN p. 2, 30, 32

SPECIFICATION CHANGE

MCO 825

symp: Cannot do IB (mode 13) to card reader or punch.

diag: Allow mode 13 and define as I (mode 10).

symp: No error message from card bunch when output attempted and device not ready.

cure: Call HNGSTP to warn user if trouble.

CDPSER p. 2

SPECIFICATION CHANGE MCO 827

symp: Cannot do image binary mode output to CDP without handling own buffers.

diag: CDP required different buffer sizes for each of 3 modes:
 27 - I, IB
 26 - B
 16 - A, AL

cure: Add an entry to all devices dispatch table (at XXXDSP-3) which UUOCON will call to set up correct buffer size if it finds buffer size = Ø in the device data block.

CDPSER p. 1, 2 UUOCON p. 32 DPCINT p. 1

MCO 828

symp: Halt in CHKTAL claiming core tables (CURTAB) and count of free core (CORTAL) do not agree.

diag: This is produced only on a swap of high sharable data segment. The fix implemented by MCO #781 was not entirely correct.

cure: Instead of using JBTADR (ITEM) to decrement CORTAL, we must use IMGOUT because JBTADR was cleared when core given back.

SEGCON p. 44, 46

symp: Monitor Listing have "," delimiting comments at beginning
 of a line.

diag: This will not work under new (V43) MACRO-10.

cure: Write TECO macro and run on all monitor files - Files requiring edit are listed below.

SCHED

UUOCON

PTPSER

PTRSER

SPECIFICATION CHANGE MCO 831

symp: For systems with more than 64K, DECtapes don't have enough room to accomodate the crash dump.

cure: Use Mag Tapes to save the crash dump. Dataline Systems
Mag Tape routine for saving crashes is merged with DEC Tape
TENDMP routine. The Mag Tape version of the utility can
be assembled by defining MAGT feature test switch.

TENDMP p. 1, 2, 4, 5, 10, 11

MCO 837

symp: "PRINTR" does not recognize VTAB as a valid character.

diag: It should.

cure: Make it - add VTAB to list of valid special characters.

PRINTR

MCO 838

symp: OPFILE does not like user to delete UFD when logging off and leave R or D command pending.

diag: When UFD missing, OPFILE cannot restore to user's UFD since it is not there.

cure: When OPFILE finds missing UFD, have it create a new one.

OPFILE

- symp: UFILE pending command (C) is inefficient and inaccurate (when user logs off, then on under a new job #).
- diag: (1) Search is by job # instead of PPN.
 - (2) Command file must be read to determine who user is.
- cure: (1) Make ID PPN rather than JOB #.
 - (2) Include a unique derivative of PPN in command file name, so that most LOOKUPS are unnecessary. Also include a random number in name so that multiple requests from same PPN have a "better" probability of finding a unique command file name on 1st try.

UFILE

MCO 840

- symp: Incomplete syntax checking in UFTLE bad syntax not diagnosed until OPFILE phase when user has been waiting for some period of time.
- diag: OFILE command scan does not check file names and extensions for legal syntax.
- cure: Include length check for $|NAME| \le and |EXT| \le 3$ and no DOT following EXT (any other break is legal).

UFILE

SPECIFICATION CHANGE MCO 841

- symp: No convenient way of deleting files from DECtapes thru FILE command.
- diag: Seems like a good feature to add.
- cure: Add it under "D" command. Change Directory command to "L".

UFILE OPFILE

SPECIFICATION CHANGE MCO 852

symp: Customers wanted more features in the Logout Cusp.

cure: The following new features have been added:

D Deletes all files

F Saves all files

U Allows you individually decide to save or protect all unprotected files

Logout treats files of all extensions the same as compared to the previous version that treates .TMP etc. specially.

LOGOUT

MCO 862

symp: Push down list overflow in monitor.

diag: Need more pushdown list space. However, the job data area cannot be expanded.

Dynamically assign PD list space from monitor free core, and move push down list up to it. Move pushdown list back to job data area when returning to user via a UUO. The number of 4 word blocks assigned to an extended pushdown list is EPL4WD, which can be redefined using MONGEN. Current setting is 12 (decimal). Pushdown list overflow message now means either: (1) not enough free core, (2) extended list overflowed too. A record of successful and unsuccessful pushdown overflows is kept in COMMON for GETTAB UUO.

ERRCON COMMON CORE1

MCO 863

symp: TIME Ø command info should be in SYSTAT.

cure: Add shuffle and zero core time to SYSTAT. Add GETTAB to find nano-seconds per memory cycle. Remove TIME Ø type-out of everything except routine for null job and KILO-CORE-SEC.

CNFTBL table

<u>item</u>	<u>location</u>	<u>use</u>
21	MEMNSP	No. of NANO-SEC PER MEMORY CYCLE (SET BY MONGEN)

symp: It takes too much core to load the monitor.

diag: A significant savings could be effected by having only one copy of DDT around instead of both EXEC DDT and USER DDT.

cure: Version 24 of DDT has been created which is capable of running in either exec mode or user mode (by containing the code for both options and doing conditional execution instead of being conditionally assembled). This new version will be distributed with the level D disk monitor.

EDDT

MCO 878

symp: MOVIE does not print more than one line.

diag: Buffer is only that long

cure: Make buffer long enough for a 64 job system with 128K of core. Append a CR-LF at end of text and print only the part of buffer stored.

MOVIE

MCO 879

symp: FILDDT takes 18.5 minutes of CPO time.

diag: Symbol table search time is very long.

cure: Make the current symbol table be COMMON most of the time since most symbols are in it and will be found more quickly. Also add local symbols in COMMON .A, .B,Z. Use these symbols in FILDDT.TXT for all intermediate symbol definitions. Symbols starting with . are found first since symbol table is sorted in backwards order.

FILDDT.TXT

symp: SYSTAT needed several improvements:

- 1. Add shuffle, zcore times
- a. Add help command
- 3. Footnote # and @
- 4. Leading zero blank or suppress times
- 5. Print (Self) for P,PN if same as this one unless we are not logged in
- 6. Prepare to make reentrant
- 7. Define GOD as Proj. 1, CTY or OPR
- 8. Make User Core be MEMSIZ-SYSSIZ
- 9. Report login availability
- 10. Rearrange null time message
- 11. Remove extra %s.
- 12. XLIST Hacques

SYSTAT

MCO 883

symp: Improve SYSTAT:

- 1. Don't say (SELF) if not logged in
- 2. Remove unused code
- 3. Round swap ratio correctly
- 4. Remove extra comma on file structures
- 5. Add comments.
- 6. Print n+nk for job size
- 7. Print #jobs in system/use/logged in/detached
- 8. Rearrange some code

MCO 884

symp: MOVIE does not print status of highest job logged in. MOVIE wastes 3 columns by printing null job status and wastes the letter A for null job.

cure: Start job status with job 1 and go through HIGHJB. Use A for low segment of job 1 in core map, B for job 2, etc.

MOVIE

symp: Occasionally the crash procedure does not halt with the PC - 525252.

diag: Continue switch bounces and an illegal UUO is executed.

cure: Put hald . in AC 10 and then halt with PC pointing to $1\emptyset$. If MA also set to 10, then continue switch bounced but caused no problem.

MCO #D-2

symp: EDDT prints octal numbers when symbols are requested.

diag: DDT prints just octal if nearest symbol is more than 100 away.

cure: change to 1000 for exec DDT and FILDDT. $A \longrightarrow B$

EDDT\$:

MCO #D-3

symp: Many tape read errors on FAILSAFE.

diag: standard density is 556 tape written at 800.

cure: change STDENS in COMMON to 3. so standard density is 800. B \longrightarrow C

MTASRX\$:

MCO #D-7 "Level C bug"

symp: NXM @ 26440 (ANYDEV+15)

diag: Item set wrong.

cure: Do a SOS on -1 (PDP) not \emptyset (PDP), - which is where item is

saved. $E \longrightarrow F$

SEGCON\$:

MCO #D-10 "Level C bug"

symp: System hung not responding to \uparrow C.

diag: A job in core has swp bit on because high seg is swapped out. The SCNJOB algorithm in swapper does not count jobs in core with SWP bit on. $G \longrightarrow H$

cure: Make SCNJOB test JBTHDR for zero rather than SWP bit in order to ignore jobs.

MCO #D-13

symp: FAILSA changes access dates when it saves files.

diag: Not using CLOSE bit 32.

cure: Change CLOSE FIL, to CLOSE FIL, $1\emptyset$ CLOSE CHK, to CLOSE CHK, $1\emptyset$ Add CLOSE's before RELEAS'S where necessary.

MCO #D-14

symp: Changed message ASSIGN MTA# FAILSA & THEN RESTART to ASSIGN
MTA# FAILSA & THEN START.

MCO #D-15

symp: When restoring FAILSA overwrites existing disk files if the same file on tape has an equal creation date and time (on if the disk file is older).

cure: As of V.26A FAILSA only overwrites existing disk files if they are older - not if the tape file is equal.

$MCO \#D-2\emptyset$

symp: K for CRASH.SAV set to 262143 when a file structure is defined.

diag: When a file structure is first defined, K for CRASH.SAV is set arbitrarily large by once-only. This forces refresher to allocate maximum amount of contiguous space possible in one retrieval pointer - determined by the size of the cluster count field in the retrieval pointer.

cure: Make the documentation clearer.

Note that K for CRASH.SAV is set to 262143 by once-only when a file structure is defined (e.g. when you dissolve and recreate the file structure).

MCO #D-22

symp: Refresher takes a long time.

diag: refresher zeros all unused blocks in all files it creates for security reasons.

cure: Set protection to 557 to take care of security problem and do not clear blocks.

MCO #D-24 "Level C bug"

symp: Garbage names for dormant segs in TBTNAM table.

diag: FNDSEG expects extension in DEVEXT (DEVDAT) to be "SHR" and it is not because UREMAP calls IOWAIT, which changes DEVDAT. Happens on GETSEG UCO of a sharable high seg while active I/O on some channels.

cure: PUSH, POP DEVDAT around call to IOWAIT.

MCO #D-27

symp: Swapping space disappears.

diag: Core parity err lights an error bit in IOS, so swapper tries different loc on disk to swap.

cure: Reference bad loc, so OPU will notice error (and stop)

FHXKON\$:

MCO #D-30 "Level C bug"

symp: PI7 glows a bit, expecially in 64 job system.

diag: COMCNT gets very large, but there are no waiting commands, that is no sign bits set in TTYTAB. This happens when ↑C is sent over a PTY, but I don't know why.

cure: A cure that adjusts COMCNT and at least saves PI7 time is to decrement COMCNT each time:

- 1. the entire TTYTAB is scanner
- 2. No delayed commands are found
- 3. No other waiting commands are found

MCO #D-36

symp:

diag: Core blocks have timing problems.

cure: Interlock FNOFIL routine as it it were a sharable resource.

MCO #D-37

symp: Reduce possibility of timing problems at the cost of some speed.

cure: 1 Monitor buffer instead of 2.

MCO #D-38 "Level C bug"

symp: System hangs in tight loop with PI4 (scanner in progress)

diag: Monitor waiting for CCI buffer empty flag to go off. Never does if PDP-8 is stopped.

BTHINT\$:

MCO #D-39 "Level C bug"

symp: Loop with PI 4 (scanner) in progress.

diag: Talk ring is not complete.

cure: Count TTPLEN times (no. of TTY+PTY+CTY lines) then quit if not got back to beginning.

SCNSRF

MCO #D-48 "Level C bug"

symp: Reproducible NXM with SPY UUO.

diag: Arg too big so NXM adr set up in user relocation.

cure: Give error return if LH of user arg is non-zero or RH is greater than size of Monitor (SYSSIZ)

symp: Hard to measure response time of programs.

Add a command called WATCH which causes monitor to autodure: matically print incremental job statistics. WATCH DAY causes the monitor to print the time of day as (HHOMM.SS) when the user started or continued a program with a monitor command. e.g. START, CONT, R, RUN, COMPIL, SYSTAT, etc. WATCH RUN, WAIT, READ, WRITE causes the monitor to print the incremental run time, the wait time (time since user started or continued program), the incremental number of disk blocks read and the incremental number of disk blocks written as (SS.HH__SS.HH RR. WW) whenever the console is returned to monitor mode via CONTROL C, EXIT, HALT, ERROR IN JOB, DEVICE XXX OK? WATCH with no arguments eliminates the printing of all incremental job statistics. Any combination of the five arguments may be typed in any order. Each occurrence of the WATCH command clears the status of previous commands. monitor does not print statistics for commands which do not start up jobs, such as ASSIGN, and PJOB. When a user logs in, his job is set to watch all incremental statistics. system administrator can change this initial setting by redefining MONGEN symbol SETWCH from 370000 to any other combinations of bits 1 thru 5, as follows:

bit 1 = setting for DAY, bit 2 = setting for RUN bit 3 = setting for WAIT, bit 4 = setting for READ, bit 5 = setting for WRITE Note: That defining SETWCH to be \emptyset with MONGEN, causes the monitor to print no incremental statistics.

If the user types an invalid argument to WATCH, the monitor responds with:

ARGS ARE: DAY, RUN, WAIT, READ, WRITE

Note that the order of the error message is the same as the order of output. Thus a user who forgets either the arguments or the significance of the statistics can find out. Note also that the incremental commands TIME and DSK terminate an increment in the same way as the incremental job statistics which have been activated by WATCH. These job statistics are included inside brackets as an indication to the user that the type out is incidental to his major interests and is not being typed out by his program. The single space between each pair of number is always typed, whether the number is or not. Thus is is possible to tell which statistics are being typed without seeing the WATCH command.

MCO #D-58 "Level C bug"

symp: A user program can turn off UWP for a spy seg and can write in monitor.

diag: Check for spy seg is not correct.

cure: Give error return if high seg is spy seg.

SEGCON

MCO #D-59 "Level C bug"

symp: FILDOT is very slow. Also typing one control C while it is running returns to command level immediately.

diag: TTCALL UUO is done after every word in a word search.

cure: Do not to TTCALL if input is from a command file.

EDDT

MCO #D-71 "Level C big"

symp: NXM on getting a non-monotonic file.

diag: Expand algorithm in COMCON assumes monotonicity.

cure: Give ADR check in non-monotonic.

EDITED

MCO #D-80 "Level C bug"

symp: Mem parity error in high seg incorrectly reports parity to be beyond end of low seg.

diag: If high seg is below low seg, the difference is negative.

```

EXPLANATION OF INSTRUCTIONS TO READ-IN YOUR MONITOR WITH TENDMP. YOU HAVE BEEN PROVIDED WITH A MONITOR WHICH HAS BEEN BUILT FOR AND TESTED ON YOUR MACHINE, (NEW MACHINES ONLY). THIS MONITOR IS ON A DECTAPE LABELED "YOUR MONITOR". TO LOAD THIS MONITOR:

1.1.1 MODERT THIS TAPE ON DECTAPE DRIVE 3 (REFERRED TO IN OCTAL AS DTAW - IN ADDRESSING THIS DRIVE THROUGH THE TELETYPE, IT WILL ALWAYS BE CALLED DTAW ALTHOUGH THE DRIVE IS DIALED TO 8).

NOTE: NO OTHER DRIVE SHOULD BE DIALED TO 8.

- 1.1.2 ASSUME THAT TENDMP HAS BEEN WRITTEN ON BLOCKS @ AND 1 OF THE DECTAPE. ON THE MAINTENANCE PANEL JUST ABOVE THE DIGITAL PDP=10 NAMEPLATE IS A ROW OF SWITCHES NUMBERED FROM 3 THROUGH Y. SET SWITCHES 4, >, AND 7 DOWN (BOTTOM PART PUSHED IN) AND ALL THE REST UP (TOP PART PUSHED IN)(DTA DEVICE CODE#320),
- 1.1,3 ON THE LOWER LEFT SIDE OF THE CONSOLE IS A ROCKER SWITCH LABELED NXM STOP, TURN OFF THIS SWITCH (FAR END DOWN), PRESS THE FOLLOWING ROCKER SWITCHES, LOCATED ON THE LOWER PANEL OF THE CONSOLE ON THE LEFT-HAND SIDE, IN THE ORDER GIVEN.

STOP RESET READ IN

DECTAPE UNIT Ø SHOULD MOVE. IF PROGRAM COUNTER LIGHTS (TOP ROW ON RIGHT HAND SIDE OF CONSOLE) START TO COUNT UP, THERE WAS NO TENDMP ON FRONT OF TAPE (USE COPY CUSP /T SWITCH OR PIP /U SWITCH), SO PUSH RESET TO STOP THE RUNAHAY TAPE AND PROCEED TO STEP 1.1.3,1. OTHERWISE THE DECTAPE WILL READ IN THE LOADER PROGRAM TENDMP. WHEN FINISHED, THE TAPE WILL STOP, AND THE TELETYPE WILL MAKE AN AUDIBLE CLICK (PROVIDED IT WAS TURNED ON), THEN PROCEED TO STEP 1.1.4

1.1.3.1 ON THE MAINTENANCE PANEL JUST ABOVE THE DIGITAL PDP=10 NAMEPLATE IS A ROW OF SWITCHES NUMBERED FROM 3 THROUGH 9, SET SWITCHES 5 AND 9 DOWN; SET ALL THE REST UP (PTR DEVICE CODE=104),

1.1.3.2 LOAD INTO THE PAPER TAPE READER THE TAPE
LABELED "TENDMP", INCLUDED IN YOUR SOFTWARE PACKAGE.
PRESS THE FOLLOWING ROCKER SWITCHES, LOCATED ON THE
LOWER PORTION OF THE CONSOLE ON THE LEFTHAND SIDE,
IN THE ORDER GIVEN.

STOP RESET READ IN

THE PAPER TAPE WILL READ AND LOAD THE LOADER PROGRAM TEADMP, WHEN FINISHED, THE TAPE WILL STOP, AND THE TELETYPE WILL MAKE AN AUDIBLE CLICK.

HUTE- A WRITHUP OF TENDMP IS INCLUDED IN THIS PACKAGE.

1.1.4 WHEN THE CONSOLE TELETYPE RESPONDS WITH A CLICK. TYPE IN

< <ALT=MOGE>

MCTE- ON MODEL 37 TELETYPES, THE ALTHODE KEY IS LABELED PREFIX.

DECTAPE & (DIALED 8) WILL SPIN FOR A FEW SECONDS, AND THE DIRECTORY WILL BE READ INTO CORE, WHEN IT HAS STOPPED, TYPE

F <ALT+MODE>
("F" FOR FILE NAMES)

THE DIRECTORY OF THE TAPE WILL BE PRINTED.

1.1.5 IN THIS DIRECTORY LISTING WILL APPEAR THE NAME OF YOUR MONITOR, IN THE FORM

XXXMON SAV

WHERE THE FIRST THREE LETTERS (XXX) ARE AN ATTEMPT TO REPRESENT YOUR COMPANY'S NAME (E.G., DECMON SAY), TYPE IN THIS NAME (FOLLOWED BY A CARRIAGE RETURN), EXACTLY AS IT APPEARS ON THE LISTING, ON THE CONSOLE TELETYPE, (DO NOT SEPARATE NAME FROM EXTENSION WITH A PERIOD.) THIS ACTION CAUSES DECTAPE B TO SPIN AS THE MONITOR IS READ AND LOADED. TENDMP WILL RESPOND WITH A BELL IF IT CANNOT FIND THE FILE OR GETS A PARITY ERROR WHILE READING,

1,2 MONITOR ONCE ONLY OPERATOR DIALOG

V15 V15 V15 1.2.1 THE MONITOR WILL REQUEST THE DATE AND TIME.

TYPE TODAY'S DATE AS ABOVE

MM=DD=YY<CR>

(MM = MONTH; DD = DAY; YY = YEAR;

E,G., 12=50=60) (<CR> IS A CARRIAGE

RETURN)

IF AFTER PERFORMING STEP 1,1,5, THE OPERATOR IS NOT ASKED BY THE MONITOR FOR DATE AND TIME!

- (Ø) CHECK THAT YOU PUT NXM STOP UP (FRONT), IF YOU DID NOT, PUT IT UP (BACK SIDE DOWN), THEN PUSH CONTINUE AND GO ON TO STEP 1,2,2,
 - (1) SET THE PROGRAM COUNTER SWITCHES TO UD0140(0).
 - (2) PRESS STOP RESET START (IN THAT ORDER).
 - (3) RESPOND TO DATE AND TIME QUERIES.

NOTE THE DATE AND TIME RESPONSES MUST BE TERMINATED BY A CARRIAGE RETURN UNLESS YOURS IS A 10-50 SHAPPING SYSTEM OR A 10/40 SYSTEM WITH DISK. IN EITHER OF THESE CASES, YOU WILL MANT TO GO THROUGH THE COMPLETE INITIALIZATION DIALOGUE IN ORDER TO DEFINE YOUR FILE STRUCTURE(S) AND "REFRESH" (INITIALIZE THE FILE STRUCTURE(S) OF) THE DISK(S). THE COMPLETE DIALOGUE IS ENABLED BY TYPING ALTMODE INSTEAD OF A CARRIAGE RETURN AFTER THE FOUR DIGITS OF TIME.

MONITR, OPR-02 PAGE 200

1.2.2 IF YOUR SYSTEM CONTAINS A DISK SUCH THAT YOU TYPED ALTHOUGH AFTER TIME-OF-DAY, GO TO STEP 1.3. OTHERWISE (YEJ TYPED A CARRIAGE RETURN), YOUR MONITOR IS ALFEADY RUNNING.

V15 V15 V15 V15

V15 V15 V15 V15 V15 V15 V15 V15 V15 V15

V15 V15

V15 V15 V15 IT IS ADVISABLE TO RUN THE SYSTEM WITH THE NXM STOP SWITCH DOWNSON THAT THE MONITOR WILL STOP IF IT TRIES TO REFERENCE BOWNEXISTENT MEMORY (OR A MEMORY BECOMES INOPERATIVE), HOWEVER THE MONITOR WILL TRY TO RECOVER FROM SUCH A PROBLEM AS BEST IT CAN, IF THE NXM SWITCH IS NOT DOWN OR IF THE OPERATOR PUSHES CONTINUE AFTER A MEMORY STOP CAUSED BY A NON-EXISTANT MEMORY REFERENCE, USUALLY ONE JOB WILL BE AFFECTED (VERY LIKELY IF NO PI'S IN PROGRESS) AND THE USER WILL RECEIVE AN "FERROR IN JOB" UXE AT EXEC INDINNING UUD AT USER MEMORM.

IT IS ADVISABLE TO RUN WITH PAR STOP SWITCH UP (NEAR SIDE UP), KATHER THAN DOWN SINCE MACHINE WILL RUN ABOUT 10 PERGENT FASTER. IF A MEMORY PARITY ERRON OCCURS, THE MONITOR WILL USUALLY BE ABLE TO RECOVER. THE MONITOR AILL HALT IF THE PARITY ERROR OCCURRED WHILE A PI WAS IN PROGRESS OR THE MACHINE WAS IN EXEC MODE SINCE THIS IS DIFFICULT TO RECOVER FROM RELIABLY. IF THE ERROR OCCURRED IN USER MODE, THE MONITOR SHEEPS THROUGH ALL OF COME, IF IT FINDS EXACTLY ONE PARITY ERROR AGAIN (USUAL) IT STOPS THE JOB AND PRINTS AN ERROR MESSAGE ON THE USERS CONSOLE AFTER ATTEMPTING TO FIX THE ERROR BY RESTORING THE VALUE IT READ OUT OF MEMORY. IF NO ERRORS OCCUR DURING THE SHEEP, IT IS COUNTED AS A SPURIOUS ERROR AND THE CURRENT USER CONTINUES. IF MORE THAN ONE ERROR OCCURS, THE MONITOR HALTS SINCE A WIDESPREAD MEMORY PROBLEM IS LIKELY. A COUNT OF

BY SETTING THE ADDRESS SWITCHES (LOCATED IN THE UPPER ROW OF SWITCHES, ON THE RIGHT SIDE OF THE COMBOLE) TO ZERO, THE USER CAN OBSERVE THE NULL JOB COUNTING. EVERY TIME THE NULL JOB IS STARTED UP AFTER ANOTHER JOB HAS BEEN RUNNING, AC 20 IS RESET TO ZERO. BY MATCHING AC 20 COUNT, AN ESTIMATE OF NULL TIME BURTS CA. BE ESTIMATED.

MONITR, OPR+02 PAGE 010

1.2.3 REMOVE THE MONITOR TAPE FROM DRIVE DTAM AND MOUNT ON THE SAME DRIVE THE TAPE IN YOUR PACKAGE LABELED "CCSP SAV FILES".

TYPE +C (HOLD DOWN THE CTRL KEY WHILE STRIKING C).
THE MONITOR WILL RESPOND WITH THE ECHO "+C" AND START
A NEW LINE WITH A ","
THEY TYPE

.ASSIGN UTAW CCR> THIS INFORMS THE MONITOR THAT
THE CUSP TAPE IS ON DECTAPE @
WHERE IT WILL RESIDE.

1.2.4 SINGE YOURS IS A NONDISK SYSTEM, YOU ARE FINISHED AND MAY PROCEED TO USE YOUR TIME+SHARING POP+10 SYSTEM.

MONITR.OPR-02 PAGE 011

1.3 HOWITOR LISK FILE STRUCTURE DEFINITION AND REFRESH DIALOG (DISK SYSTEMS ONLY)

1.3.1 UPGN RECEIVING AN ALTMODE FOLLOWING TYPEIN OF THE TIME-OF-DAY, YOUR MONITOR WILL TYPE A SUMMARY OF THE IZO CONFIGURATION FOR WHICH IT WAS BUILT, AND WILL PROCEED TO ASK FOR THE OPERATOR'S CONSOLE NAME, THE DEVICE WHICH YOU SPECIFY WILL BECOME THE ONE TO WHICH MESSAGES FOR LOGICAL DEVICE "OPR" WILL BE SENT, A MECOMMENDED RESPONSE TO THIS QUESTION IS

LTY COR>

V14 V14

v14 v15 (<CR> IS A CARRIAGE RETURN)

1.3.2 NEXT, YOU WILL BE GIVEN THE OPPORTUNITY TO RETAIN

IN CORE THREE OPTIONAL MONITOR COMPONENTS CALLED MOVIE, SYSMAK,

AND EXEC DDT. THESE ARE USEFUL FOR EXAMINING THE CURRENT MONITOR,

FOR CREATING NEW MONITORS, AND FOR DEBUGGING THE CURRENT MONITOR,

RESPECTIVELY; THEY ARE USUALLY NOT RETAINED.

A PESPONSE OF CARRIAGE RETURN WILL DELETE THESE ROUTINES AND MAKE THE SPACE THEY OCCUPY AVAILABLE AS USER CORE.

V14 YOUR ANSWERS TO THESE THREE QUESTIONS WILL DETERMINE THE FIGAL SIZE OF THE MONITOR (THIS SIZE IS TYPED AT THE END OF THE ONCE ONLY DIALOG.

V14
1.3.3 NEXT YOU MUST SET UP THE DISK FILE STRUCTURE, FOR V14
DETAILS SEE LEVELD.MEM SECT, 4.2, AND DSK016,MEM V14
SECT, 4.2 AND 4.3.

1.3.4 IT IS COMMON PRACTICE TO INCLUDE THE ACCESS PROTECTION
FEATURE CALLED LOGIN IN ALL SYSTEMS CONTAINING DISKS.

V14 THE LOGIN MECHANISM REQUIRES THE PRESENCE OF THREE FILES
CN THE DISK! THE LOGIN CUSP (LOGIN,SAV) AND THE SYSTEM

V14 ACCOUNTING FILES (ACCT,SYS AND AUXACC,SYS), ALTHOUGH YOUR
MOLITOR IS NOW RUNNING, THESE REQUIRED FILES ARE MISSING
FRUM THE NEWLY REFRESHED DISK, FOR THIS REASON, AN AUTOMATIC LOGIN IS ALLOHED FOR THE FIRST USER TO TYPE THE LOGIN
COMMAND AFTER THE DISK HAS BEEN REFRESHED.

TYPE

LUGIN (CR)

THE SYSTEM RESPONDS WITH

JOB1 CYOUR MONITOR NAME>

YOU ARE NOW LOGGED IN UNDER THE PRIVILEGED FAILSAFE NUMBERS 1,2 SO THAT YOU MAY WRITE ON ANY DISK AREA WITH ANY CUSP.

SET NXM SWITCH DOWN, MEM PARITY UP, AND ADDRESS SWITCHES TO \odot . SEE SECTION 1.2.2 FOR DISCUSSION OF THESE SWITCHES AND WHEN IT IS ADVISABLE TO SET THEM DIFFERENTLY.

MONITH.OPR-02 PAGE 012

V16
V16
V16
                NOW RESTORE YOUR ACCOUNTING FILES FROM DECTAPE OR DISK
v16
v16
                WHEREVER YOU HAVE WRITTEN THEM. IF YOU ARE A NEW CUSTOMER, YOU WILL NEED TO CREATE THEM. TO DO THIS SEE
V16
                SECTIONS 5,6,2 IN LEVELD, MEM, SECTION 13,15 IN OSKO16, MEM,
```

V16 1.5.4 RESTORE YOUR ACCOUNTING FILES

ALONG WITH THE CUSPS AN ACCOUNTING FILE (ACCT.SYS) WAS LOADED WITH THE FOLLOWING ENTRIES:

PHOJECT NO.	PROG. NO.	PASSWORE
1	2	FAILS
ī	4	CUSP
10	7	DIST
7	7	OPER
6	6	TELAM
100	100	DEMO1

YOU WILL PROBABLY WANT TO RUN THE CUSP REACT TO ADD YOUR CWE NUMBERS AND CHANGE THE PASSWORD FOR FAILSAFE (1,2) AND CUSP (1,4). YOU SHOULD ASSIGN PROJECT NUMBERS AND PROGRAMMER NUMBERS STARTING WITH 11 TO YOUR USERS. DIGITAL HAS RESERVED 1-10 FOR SPECIAL PURPOSES. YOU WILL ALSO NEED TO MAKE ADDITIONS TO THE DISK QUOTA ADMINISTRATIVE FILE AUXACC.SYS. THIS IS ALSO DONE WITH REACT, SEE SOFTWARE NOTEBOOK, LEVELD, MEM SECTION 5.6.2. DSK016.MEM SECTION 13.15. THE AUXACC.SYS FILE HAS QUOTAS FOR [1,*],[6,*],[7,*],[10,*],[100,*] OF MRSKVD, 100000 FCFS, 1000000 LOGGED OUT ON DSKA,DSKB, AND DSKC.

THE SOURCE FILES FOR ALL THE SYSTEM SOFTWARE HAVE BEEN SAVED WITH FAILSAFE ON MAGNETIC TAPES IN THE FOLLOW-ING MANNER:

USER AREA CONTENTS

ON MONITOR MAGTAPE:

10,7 SOURCES, MONITOR AND MONITOR SUPPORT CUSPS DOCUMENTATION, SAV FILES

ON CUSP MAGTAPE!

14,7 CUSP SOURCES AND RELATED .OPR FILES DOCUMENTATION, SAV FILES

THESE FILES MAY BE ACCESSED BY LOGGING IN UNDER THE RELATED NUMBER AND RESTORING THE DESIRED FILES WITH FAILCD, FILES MAY BE RESTORED EITHER COMPLETELY FOR A USER AREA OR INDIVIDUALLY. AFTER DOING THIS, IT IS RECOMMENDED YOU COPY THE FILES FROM DISK TO YOUR OWN DECTAPES FOR SAFE KEEPING WITH PIP, FOR THE MONITOR SOURCES, BE SURE TO COPY THEM IN THE PROPER ORDER TO MAKE 17 MONITOR SOURCE DECTAPES. SEE TABLE, TXT FOR A LISTING OF FILE NAMES FOR EACH DECTAPE. THE MONITOR ASSEMBLY INSTRUCTIONS ASSUME THAT THE MONITOR SOURCES ARE ON DECTAPES AND DESCRIBE HOW TO COPY THEM ONTO THE DISK, IF YOU WISH TO SPEED UP THE ASSEMBLY PROCESS.

v14

V14

(1.5.2,2 Cd.T'C)

JF YOU HAVE A SINGLE BURHOLGHS DISK (HD-10) IT WILL NOT HOLD THE CONTENTS OF THE FAILSAFE TAPE, SINCE IT IS EVER NECESSARY TO RESTORE ALL THE SOURCE FILES AT ONE TIME THIS SHOULD NOT BE AN INCONVENIENCE.

EXAMPLE: TO RESTORE ALL LIBRARY SOURCES

UG. 3 45.45 TS MONITOR #1 .7 PASSWORU:

V15
V15
                   RUN DTAZ MONGEN
                   FOLLOWED BY CARRIAGE RETURN TO SPMON TO LOAD AND START THE CONFIGURATION DEFINITION DIALOG
                   PROGRAM, MONGEN.
```

2.1.12 MC GEN WILL RESPOND WITH

TYPE "DEVICE: VAME CCR>" FOR WHERE TO PUT RESULTS

OF THIS DIALOG, OR ASSUMES "DSK! CONFIG. MAC"

SINCE SPMON DOES NOT HAVE A DSK (LAMGER 10/30 MONITORS HAVE A DISK FILE STRUCTURE WHICH IS INCOMPATIBLE WITH 1 /4/2 AND 10/50 SYSTEMS), TYPE DTALLCONFIG FOLLOWED BY CARRIAGE RETURN TO MONGEN (AFTER YOU HAVE MADE YOUR MONITOR, YOU WILL BE ABLE TO REM MONGEN, SAV UNDER IT INSTEAD OF MONGEN, SYE DARKE SPHON)

2.1.13 MONGEN WILL TYPE

A SWER THE FOLLOWING QUESTIONS WITH Y OR N
ON A DECIMAL NUMBER

SHORT DIALOG? EN=LONGER QUESTIONS]

IT IS RECOMMENDED THAT YOU TYPE N FOLLOWED BY CARRIAGE RETURN UNTIL YOU ARE MORE FAMILIAR MITH MONGEN, BECAUSE MONGEN WILL EXPLAIN THE GULSTIONS MORE FULLY BY TYPING EXTRA COMMENTS INSIDE SQUARE BRACKETS.

- 2.1.14 MONGEN WILL WRITE EACH QUESTION,
 ASSAER AND SYMBOL DEFINITION IN FILE CONFIG, MAG.
 BECAUSE MOST OF THE QUESTION ARE STRAIGHTFERARD, THEY MAVE NOT BEEN INCLUDED HERE, SEE THE
 LISTING OF CONFIG, MAC IN MONITOR LISTING OF COMMON
 FOR A SAMPLE DIALOG, UNLY A FEW ARE EXPLAINED MORE
 FULLY BELOW.
- 2.1.14.1 TYPE "SYMBOL, VALUE" (VALUE IN DECIMAL)

 FOR ANY SYMBOLS TO BE DEFINED. TYPE EXTRA

 V14 CARRIAGE RETURN WHEN THROUGH, THEN IT WILL ASK THE
 V14 SAME QUESTION FOR OCTAL VALUES,

v15

V15 V15 V15 V15 IF YOU DISCOVER THAT YOU ARE RUNNING MONGEN OFTEN,
IT IS RECOMMENUED THAT YOU EDIT THE BEGINNING OF
COMMON, MAC EAND/OR COMMOD, MACJ SO THAT YOU HILL NOT
ACCIDENTALLY BUILD A MONITOR WITH AN INCORRECT SYMBOL
VALUE, HOWEVEN FOR THE FIRST FEW TIMES: CHANGING
THE SYMBOL VALUES WITH MONGEN WILL SUFFICE.

THE FOLLOWING SYMBOLS CAN BE CHANGED TO BE DIFFERENT FROM THE STANDARD, THEY ARE SHOWN WITH THEIR STANDARD (DECIMAL) VALUES, IF YOU ARE SATISFIED WITH THE STANDARD, JUST TYPE CARRIAGE RETURN LINE FEED, IF YOU OC DECIDE TO CHANGE ONE OR MORE OF THE FOLLOWING SYMBOLS, TYPE THE SYMBOL FOLLOWED BY ITS DESIRED VALUE SEPARATED BY A COMMA. PUT EACH SYMBOL DEFINITION ON A SEPARATE LINE. TYPE AN EXTRA CARRIAGE-RETURN LINE-FEED WHEN DONE.

- 2,1,14,1,3 JIFSEC,62

 PUWER FREQUENCY IN HERTZ (CYCLES PER SECOND).

 SOME INSTALLATIONS SHOULD CHANGE THIS TO

 50 SO THAT ACCOUNTING AND TIME OF DAY WILL BE CORRECT.
- 2.1.14.1.4 DITRY,4

MONITH. OPR-02 PAGE 032

2.1.15 PI CHANNEL ASSIGNMENTS CAN BE CHANGED FROM THEIR STANDARD VALUES WHEN ADDING SPECIALIZED I/O ROUTINES FOR CUSTOMERS' NON-STANDARD DEVICES.

FI ASSIGNMENTS ARE MADE BY GROUPING I/O DEVICES BY RELATIVE SPEED OF INTERRUPTS, AS SHOWN BELOW. IF ANY DEVICE IN A GROUP IS PRESENT, A PI CHANNEL WILL BE ASSIGNED TO THAT GROUP, THUS THE EXACT PI ASSIGNMENT FOR A GIVEN DEVICE VARIES DEPENDING ON THE PRESENCE OF OTHER DEVICES.

IN ADDITION, THE DEVICES ADDED BY A CUSTOMER DURING THE MONGEN DIALOG WILL BE CHAINED ON THE REQUESTED CHANNEL. IF A DEVICE REQUIRES THE EXCLUSIVE USE OF A PI CHANNEL, THAT MAY BE DECLARED TO MONGEN AFTER DECLARING THE NAME OF THE SPECIAL DEVICES.

THE DEVICE GROUPS ARE AS FOLLOWS (THESE MAY BE CHANGED BY RE-ARRANGING THE DEVICES IN INTTAB, IN THE SOURCE OF COMMON):

	GROUP NUMBER (NOT PI CHANNEL)	DEVICE	NAME
	1	DCB	134 DATA CONTROL FOR 270 DEFE
	5	MTA	136 DATA CONTROL FOR 270 DISK
	2 3	DCT	TM10A DATA CHANNEL
	•	ac i	136 DATA CONTROL FOR \$51 OR 516 TAPE CONTROLS
	4	DTA	TO10 DECTAPE DATA CHANNEL
	5	CDR	461 OR CRIN CARD READER
	5	APR	KA10 OR 166 ARITHMETIC PROCESSOR
	6	SCN	DC10,680, OR 630 TELETYPE SCANNER
	6	PTR	PAPER TAPE READER
	6	LPĪ	LINE PRINTER(S)
	6	DTA	DECTAPE FLAG CHANNEL (DTA OR DTC)
	6	MTA	MAGTAPE FLAG CHANNEL
	6	CTY	CONSOLE TELETYPE
	7	DSK	DISK FLAG CHANNEL (FHD, MDF, DPC, OR DPD)
V11	7	PEN	LIGHT PEN
	7	PTP	PAPER TAPE PUNCH
	7	CDP	CARD PUNCH
	7	PLT	PLOTTER
	8	DIS	DISPLAY DATA CHANNEL
	9	CLK	SCHEDULER, CLOCK ROUTINES.
		•	(ALWAYS ASSIGNED TO CHANNEL 7.)

- 2.2 ASSEMBLE SOCONFIGOCOMMON LAND SOCONFIGOCOMMODI USING MACRO
 - 2.2.1 WHEN MONGEN TYPES "EXIT °C", YOU HAVE CREATED FILE CONFIG.MAC (ON DTA1 IF USING SPMON), NOW YOU MUST ASSEMBLE IT WITH S.MAC AND COMMON.MAC TO PRODUCE COMMON.REL.
 - 2.2.2 TYPE

 ASSIGN DTA2

 FOLLOWED BY CARRIAGE RETURN TO SPMON TO ASSIGN DECTAPE UNIT 2.
 - 2.2.3 MOUNT A BLANK TAPE ON DTA2

 SET THE UNIT TO WRITE ENABLED

 TYPE:

 R PIP

 CLEAR THE DIRECTORY ON DTA2 BY TYPING:

 DTA2: */ #

 PIP **ILL RESPOND WITH A ** WHEN IT IS DONE

 THEN TYPE:

 (C(NTROL) C
 - 2.2.4 TYPE

 R MACRO
 FOLLOWED BY CARRIAGE RETURN TO SPMON, TO LOAD
 AND START MACRO, THE SYMBOLIC ASSEMBLER.
 MACHO WILL TYPE AN * AND WAIT FOR INPUT.

 CIF YOU ARE RUNNING UNDER A 10/40 OR
 10/53 MONITOR INSTEAD OF SPMON, ALSO TYPE
 R MACRO].

```
2.2.5 TYFE

DTAZICOMMON-DTAIIS, CONFIG, COMMON
FOLLOWED BY CARRIAGE RETURN TO MACRO,
THE ASSEMBLER WILL MAKE TWO PASSES OVER THE
SOURCE FILES AND PRODUCE COMMON, REL ON
DECTAPE UNIT 2. WHEN MACRO IS FINISHED, IT
SHOULD PRINT NO ERRORS DETECTED
FOLLOWED BY **. IF THE ASSEMBLER SHOULD DETECT
SOME ERRORS, CHECK YOUR MONGEN DIALOG,
ESPECIALLY WHERE YOU DEFINED SPECIAL SYMBOLS
OR DEVICE ROUTINES, MAKE SURE THAT YOU
SEPARATED EACH FIELD WITH A COMMA AND
TYPED NO SPACES. (MONGEN TAKES EACH SUCH
LINE AND PASSES IT DIRECTLY TO CONFIG.MAC),
IF YOU CANNOT FIND YOUR ERROR, PERFORM
THE ASSEMBLY OVER AGAIN WITH A LISTING:
DTAZICOMMON.LPTI-DTAIIS, CONFIG, COMMON
AND LOOK TO SEE WHERE ERROR OCCURRED,

V15

CFOR LEVEL D DISK SYSTEMS ONLY, ALSO TYPE:

TO MACRO AFTER IT HAS FINISHED PREVIOUS ASSEMBLY
AND HAS TYPED **

IF YOU ARE INTERESTED IN LOOKING AT THE LEVEL D CORE
BLOCKS WHILE RUNNING IN EXEC MODE, TYPE THE FOLLOWING
COMMAND STRING INSTEAD:
V15

OTAZICOMMOD-DTAIIS, CONFIG, DATDMP, COMMOD
THIS WILL INCLUDE DATDMP WHICH IS ABOUT 700 OCTAL LOCATIONS LONG

2.2.6 TYPE

CONTROL>C
TO MACRO AFTER IT HAS FINISHED ASSEMBLY AND HAS
TYPED * TO
RETURN TO SPHON COMMAND LEVEL.
```

2.3 LOAD COMMODIREL [AND COMMODIREL] FOLLOWED BY MONITOR LIBRARY FILE USING LOADER. (SEE REFERENCE HANDBOCK FOR EXPLANATION OF LOADER COMMANDS AND SYMBOLS.)

2.3.1 TYFL

V14

V14

FOLLOWED BY CARRIAGE RETURN TO SPMON WHICH WILL LOAD LOADER, SVE WHICH IS A STANDARD LOADER SAVED TO RUN UNDER A 1/32 MONITOR INSTEAD OF A 10/40 OR 10/50 MONITOR. LIF YOU ARE LOADING UNDER TIME SHARING INSTEAD OF SPMON ALSO TYPE R LOADER), LIF YOU ARE MAKING A 10/50 SYSTEM YOU MUST REPLACE THE "10/40 MONITOR MAKER" (TAPE #2) TAPE WITH THE "12/50 MONITOR REL FILES" TAPE (TAPE #7) AFTER YOU HAVE GOTTEN THE LOADER OFF OF IT (WITH THE R COMMAND). TO DO THIS TYPE (CONTROL>C FOLLOWED BY!

ASSIGN DIAG SO THAT SPHON WILL KNOW TO READ THE DIRECTORY AGAIN. THEN REPLACE "19740 MONITOR MAKER" TAPE (TAPE #2) WITH "1 750 MONITOR REL FILES" TAPE (TAPE #7) AND FINALLY TYPE! START TO SPMON TO RETURN TO THE LOADER!

2.3.2 NEXT YOU MUST TYPE THE LOADER COMMAND STRING TO CAUSE
IT TO LOAD YOUR TAILOR MADE COMMON, REL FROM DTA2 AND
DO A LIBRARY SEARCH OF >N##, REL OR 55##, REL ON
DTA. THE LONG MONGEN DIALOG TYPED OUT THE APPROPRIATE COMMAND STRING FOR YOU TO USE. THE FOLLOWING
SECTIONS, 2.3.2 THROUGH 2.3.4 DESCRIBE THE LOADER
COMMAND STRINGS, IN CASE YOU DID NOT SPECIFY THE
LONG DIALOG. IF YOU DISCOVER YOU MADE A MISTAKE BEFORE
TYPING /G, YOU MAY START LOADER OVER AGAIN MERELY BY
TYPING CONTROL>C
START
FOLLOWED BY CARRIAGE RETURN TO MONITOR.

2.3.3 TYFE

/S
FOLLOWED BY CARRIAGE RETURN, TO LOAD LOCAL SYMBOLS FOR DEHUGGING THE MUNITOR WITH EXEC DOT OR PATCHING WITH EXEC DOT (STAND-ALONE IN EXEC MODE OR UNDER TIME SHARING IN USER MODE).

2.3.4 TYFL

V14

DTA2:COMMON.DTA0:5N##/L

FOLLOWED BY CARRIAGE RETURN IF YOU ARE BUILDING A 10/40

NOL-DISK SYSTEM OR TYPE!

V14

DTA21COMMON, COMMOD, DTA015S##/L

FOLLOWED BY CARRIAGE RETURN IF YOU ARE BUILDING A LEVEL D

DISK SYSTEM (1/2/40 D OR 10/20) SYSTEM. THE /L TELLS THE

LOADER TO DO A LIBRARY SEARCH RATHER THAN LOAD EVERY FILE

V14

IN 54##, REL OR 5S##, REL, COMMON, REL CONTAINS THE PROPER

EXTERNAL DECLARATIONS TO LOAD JUST THE ROUTINES NEEDED FOR

YOUR CONFIGURATION.

2.3.5 TYPE1

LPT:+/A/M/P/G

V15

NOTE: EXEC DDT (EDDT V24) WILL EXECUTE EITHER IN EXEC
V15
MODE OR USER MODE, SO THAT ONLY ONE COPY OF DDT WILL
V15
SUFFICE FOR PATCHING UNDER TIME SHARING OR STAND+ALONE,

THE LOADER WILL PRINT A STORAGE MAP ON THE LINE PRINTER AND WILL TYPE EXIT WHEN IT IS THROUGH, IF YOU DO NOT HAVE A LINE PRINTER, TYPE PP/G
FOLLOWED BY CARRIAGE RETURN

THE /A PRECEDING THE /M CAUSES
THE LOADER MAP TO INCLUDE ALL GLOBAL SYMBOLS
INCLUDING ZERO LENGTH FILES (JOBDAT), THE /P SWITCH
PREVENTS THE LOADER FROM SEARCHING THE LIBRARY IN
CASE THERE ARE UNDEFINED GLOBALS, THE /G IS EQUIVALENT
TO ALTMODE AND SEEMED LESS CONFUSING TO INCLUDE HERE
SINGE THE USER CAN END ALL COMPUTER INPUT WITH CARRIAGE
RETURN.

INSTEAD OF PUTTING THE STORAGE MAP ON THE LINE PRINTER YOU MAY HISH TO PUT IT ON DTAZ INSTEAD FOR LATER PRINTING. IF SO TYPE

DTA21XXXMON+/A/M/P/G

WHERE XXXMON IS THE NAME OF YOUR MONITOR, THE LOADER WILL HRITE STORAGE MAP AS FILE XXXMON, MAP ON DTA2, IF YOU GET ANY MULTIPLY DEFINED GLOBALS CHECK TO SEE THAT YOU TYPED /L IMMEDIATELY FOLLOWING SN## OR 55##, IF LOADER RUNS OUT OF CORE, IT WILL PRINT CORE EXCEEDED FILE 5N## [OR 55##] CHECK TO MAKE SURE YOU ARE USING THE LARGEST SPHON FOR YOUR MEMORY SIZE (SPMON, 16K, SPMON, 32K, SPMON, 48K) IF YOU WERE NOT, RELOAD LARGEST SPMON HICH WILL FIT IN YOUR MEMORY AND GO BACK TO STEP 2.3. GMECK TO MAKE SURE YOU TYPED /L AFTER THE LIBRARY FILE, OTHERWISE LOADER HAS ATTEMPTING TO LOAD ALL FILES, TO RECOVER, TYPE (CONTROL)C START TO MONITOR, IF CORE IS STILL EXCEEDED TYPE (CONTROL)C START TO MONITOR, STEPS 2.3.3 THRU 2.4.5 EXCEPT DO NOT LOAD LOCAL SYMBOLS (/s.).

IF THIS FAILS TRY LOADING WITHOUT EXEC DDT (MUST REPEAT MONGEN DIALOG AND ANSWER N), AND WITHOUT LOCAL SYMBOLS.

V14

V14

2.4 SAVE SENITER USING MONITOR SAVE COMMAND 2.4.1 YOU HAVE JUST LOADED YOUR MONITOR INTO CORE USING EDADER, NOA YOU MUST SAVE IT ON DECTAPE SO THAT IT CAN BE LEADED BY TENDMP. v15 MONXXX SATE BVAS FOLLOWED BY A CARRIAGE RETURN TO SPMON, WHERE XXXMON IS THE NAME YOU WOULD LIKE TO GIVE TO YOUR MONITOR, SPICE ALL WRITE FILE XXXMON, SVE ON DIAZ. IF YOU ARE NOTHING UNDER TIME SHARING, THE MONITOR WILL WRITE FILE XXXMON, SAV 195TEAD, TENDMP WILL BE ABLE TO LOAD ETTHER. MARMINS - NEVER COPY A , SVE OR , SAV FILE ONTO A DECTAPE AITH PIP WHICH YOU MAY WISH TO LOAD WITH TENOMP (EG SOLITOR OR SOME MAINTENANCE PROGRAMS). ALWAYS USE THE MONITOR GET AND SAVE COMMANDS INSTEAD, PIP (AITH /B SHITCH) IS FINE FOR ORDINARY USER PROGRAMS AND CUSPS EVEN THOUGH THEY ALSO HAVE EXTENSIONS OF SAV AND SWESTED TO USE ALL NEVER LOAD THEM WITH TENDMP. THE REASON FOR THIS RESTRICTION IS THAT TENDMP ASSUMES THAT THE FIRST BLOCK OF A FILE IS THE LOKEST ONE ON THE TAPE FOR THAT FILE. TENDMP FOLLO HAVE TO BE LARGER IF IT WAS TO BE MADE v15 V15 V15 V15 COSPATIBLE. v15 2.4.2 DECTAPE DTAZ SHOULD NOW CONTAIN THE FOLLOWING FILES COMMON. REL [IF LEVEL-D DISK]
[IF YOU WROTE STORAGE MAP HERE] COMMOD REL V14 SAM, KUMXXX XXXMON.SVE LOR XXXMON, SAV IF UNDER TIME SHARING] V10 2.4.3 AFTER CHINGING UP YOUR LEVEL D MONITOR. LOGIA UNDER 1,4 AND SAVE YOUR MONITOR ON A SLOW SPEED FILE STRUCTURE WITH THE NAME SYSTEM, SAV. THEN YOU WILL BE ABLE TO LUAD IT MERELY BY TYPING CARRIAGE RETURN TO BOOTS, V16 V16 V16

           3.1.3.3 ASSEMBLE SOURCE TAPE 4
                          BY TYPING!
                           .R MACRO
                          TO THE MONITOR, FOLLOWED BY:
                          RL41S42RL4,CCLP
V14
                         FOLLOWED BY A CARRIAGE RETURN TO MACRO, WHERE @ IS THE "EACH" SIGN (NOT ALT-MODE), THIS WILL CAUSE MACRO TO READ COMMAND FILE SAURLA.CCL, IT WILL TYPE OUT THE TITLE OF EACH PROGRAM AS IT IS ASSEMBLED. IT WILL PRINT THE NUMBER OF ERRORS ONLY IF IT FINDS ANY (WHICH IT SHOULDN'T), WHEN ALL THE ASSEMBLIES ARE COMPLETE, MACRO WILL PRINT EXIT AND THE TELETYPE WILL BE RETURNED TO MONITOR MODE.
V14
           3.1.3.4 LIST THE DIRECTORY OF LOGICAL DECTAPE "RL4", BY TYPING:
                          R PIP
V14
                          eTTYI+RL4:/L
                          *<CONTROL>C
                          TO THE MONITOR AND PIP, CUT OUT AND TAPE THE DIRECTORY
V14
                          ON THE UNIT RL4.
```

3.1.3.5 REPOVE LOGICAL DECTAPE "RL4", MOUNT A SECOND
ELAPK TAPE ON LOGICAL UNIT "RL4"

3.1.3.6 TELL THE MORITOR THAT YOU HAVE MOUNTED NEW DECTAPES BY
TYFING THE ASSIGN COMMAND FOR EACH PHYSICAL UNIT, THIS
IS IMPERTANT! IF YOU DO NOT DO THIS, THE MONITOR WILL
USE THE DIRECTORY IT HAS IN CORE RATHER THAN THE ONE ON
TAPE.
EXAMPLE! ASSUME THAT THE HONITOR HAD ASSIGNED PHYSICAL
DEVICE DTAY AS LOGICAL UNIT "RL4".

17FE
4SSIG: DTAY RL5
SINILARLY, ASSIGN "5" ON THE DRIVE USED FOR "4",
3.1.3.7 REPLAT STEPS 3.1.3.2 THROUGH 3.1.3.6 FOR EACH TAPE

TO BE ASSEMBLED.

V14

```
3.1.4 FILE 54DETH.CCL WILL PRODUCE 90TH MONITOR REL (RELOCA-
                       TABLE BIRARY) FILES AND CREE IMPUT IN DARALLEL FOR A 14/4- SYSTEM BSING A 14/48 SYSTEM WITH 1 MAGTARE AND 7

                      EXIT.
                                                 [MACRO TERMINATES]
                      RPIP
                      *TTYI-RL41/L
V14
                                                 ELIST THE DIRECTORY OF UNIT "RL1"]
                      .<CONTROL>C
                      ASSIGN DIAN RLD [WHERE DIAN IS PHYSICAL UNIT ASSIGNED TO "RL1"]
V14
                      TREMOVE TAPE FROM RL1, ATTACH IT'S DIRECTORY AND MOUNT A BLANK DECTAPE ON SHAT IS NOW LOGICAL UNIT RL2] REFEAT ABOVE SUBSTITUTING "RL5" FOR "RL4" AND """ FOR "4"
V14
V14
                      REPEAT AGAIN FOR EACH TAPE,
                      THE FULLOWING INSTRUCTIONS ASSUME THAT YOU HAVE A DISK
```

WHICH WILL HOLD AT LEAST MONITUR SOURCE TAPE 3, ZERO DISK DIRECTORY.

V14

```
3.1.5.2 CDEY THE MAC FILES ON MONITOR SOURCE TAPE 3 TO
                       THE DISK BY TYPING
v14
                       ASSIG DTA 5
V14
                      TO THE MONITOR AND MOUNTING MONITOR SOURCE TAPE 3 ON
                      THE PHYSICAL USELT THE MONITOR ASSIGNED.
                      R PIP
                      TO THE MONITOR FOLLOWED BY
v14
                       *D5K1/X/B+31*, MAC
                       TO PIP WHICH BILL CAUSE PIP TO TRANSFER ALL OF THE FILES WITH EXTENSION .MAC TO THE DISK. THE ZX SKITCH CAUSES PIP TO RETAIN THE SAME NAMES ON THE DISK. RATHER THAN
                       COMBINING ALL OF THE FILES INTO COE. THE ZB SWITCH MEANS COPY IN BINARY AND SHOULD ALWAYS BE USED WHEN COPYING WITH ZX AS A HABIT BECAUSE WITHOUT IT. PIP DOUBLES THE LENGTH OF YOUR FILE
v14
                       WHEN GOING FROM DISK TO DECTAPE. USING THE /B SWITCH IS ALSO A GOOD HABIT SINCE YOU NEVER HAVE TO HORRY ABOUT WHETHER THE DATA IS REALLY BINARY OR NOT.
          3.1.5.3 COPY AS MANY OF THE OTHER MONITOR SOURCES ONTO THE DISK AS
                       YOU HAVE ROOM FOR ALTHOUGH JUST TAPE 3 GREATLY INCREASES EFFICIENCY AS S.MAC AND THE FEATURE FILES ARE ON IT. BE
V14
                       SURE TO ASSIGN THE DECTAPE UNIT BEFORE MOUNTING EACH
V 1 4
                       TAPL. AT LEAST THE COL FILES HUST BE COPIED TO DISK.
          3.1.5.4 FOR EVERY MONITOR SOURCE TAPE THAT YOU ARE GOING TO LEAVE
                       ON THE DECTAPE DRIVES, MAKE SURE THAT YOU HAVE GIVEN THEM THE APPROPRIATE LOGICAL NAMES "4","5", AND "6", LTC, FOR EVERY TAPE YOU COPIED TO THE DISK TYPE:
v14
V14
                       .ASSIGN DSK 3
v14
                       .ASSIGN DSK 4
V14
                       .ASSIGN DSK 5
v14
                       .ASSIGN DSK 6
                          ETC.
                      IT IS POSSIBLE TO GIVE THE DISK MANY LOGICAL NAMES SIMULTANEOUSLY WHILE EACH DECTAPE CAN HAVE ONLY ONE LOGICAL NAME, IF MONITOR PRINTS OUT LOGICAL NAME ALREADY IN USE, DEVICE XXX ASSIGNED, FIRST DEASSIGN OLD NAME (SAY IT WAS 3) BY TYPING
v14

MONITH, OPR-02 PAGE 046

3.1.7 ASSEMBLE MONITOR SOURCES BY HAND. SING MACRO LINGLUDED. HERE FOR COMPLETENESS CALY SEE SECTION 3.1.1 THROUGH 3.1.6 FOR AUTOMATIC ASSEMBLY OF ENTIRE MONITORI

3.1.7.1 DESCRIPTION OF MONITOR SOURCES

THERE ARE OVER 32 MACRO SOURCE FILES TO THE COMPLETE MONITOR. SOME OF THE FILES MAY BE ASSEMBLED BY THEM-SELVES WHILE OTHERS MUST BE ASSEMBLED WITH A SYSTEM SYMBOL DEFINITION FILE CALLED S.MAC

WITHIN S, CERTAIN SPECIAL SYMBOLS ARE DEFINED TO HAVE THE VALUE & OP -1. THESE VALUES CONTROL THE ASSEMBLY OF GERTAIN FLATURES IN THE MONITOR. THESE SYMBOLS ARE CALLED FEATURE SWITCHS AND ALL BEGIN WITH THE LETTERS FT. IF A SWITCH IS ASSIGNED THE VALUE -1, THE ASSOCIATED FEATURE WILL APPEAR IN THE ASSEMBLY. IF ASSIGNED THE VALUE &; THE FEATURE WILL NOT APPEAR, SEE LISTING OF S.MACFOR A DESCRIPTION OF EACH FEATURE.

FILES ASSEMBLED WITH THE VERSION OF S.MAC SUPPLIED WILL CONTAIN THE FULL DUPLEX FEATURE. IN ORDER TO REMOVE THE FULL DUPLEX FEATURE, I.E. PRODUCE A HALF-DUPLEX VERSION OF THE FILES, IT IS NECESSARY TO SET THE SWITCH FTCCL=## THE VALUE OF THE FEATURE SWITCH FTTTYSER=###, THIS MAY BE DONE #ITH TECO. HEN ASSEMBLING A HALF DUPLEX LIBHARY, IT IS NECESSARY TO SET THE SMITCH FTCCL=### IN FT5%S.MAC IF IT IS REQUIRED IN THE ASSEMBLY OF YOUR PARTICULAR CONFIGURATION.

SOME OF THE FILES MUST BE ASSEMBLED WITH BOTH S AND AN APPROPRIATE FEATURE SYMBOL DEFINITION FILE WHICH CONTROLS CONDITIONAL ASSEMBLY DETERMINED BY WHICH OF THE 3 SYSTEMS IS BEING ASSEMBLED FOR, EACH FILE CONTAINS FEATURE SWITCHES WHICH SPECIFY WHICH OF THE 3 POSSIBLE SYSTEMS ARE TO BE ASSEMBLED.] THESE FEATURE SWITCHES ARE IN SEPARATE FILES CALLED!

SYSTEM FILE NAME

V11 V11

4_√	FT42N+MAC	10/40 NON-DISK
4 ₹ 0	FT470+MAC	18/48 DISK (ALL TYPES)
5 k D	FT5/S.MAC	10/50 SNAPPING (ALL DISK TYPES)

(CONT!S)

EXPLANATION OF SYSTEM NAMES!
THE FIRST 2 CHARACTERS SAY WHETHER THE SYSTEM IS NONDWAPPING (4) OR SKAPPING (50)
THE THIRD CHARACTER SAYS RON-DISK (11), MON-SWAPPING
DISK (1), SKAPPING (5)

AFTER ASSEMBLING THE REQUIRED SOURCES, THE RELOCATABLE BY ARY (.REL) FILES MUST BE COMBINED INTO A LIBRARY FILE USING PIP SO THAT THEY MAY BE LUAND USING THE OFFICE ASSEMBLING THE MONITOR THE USER MUST DECIDE WHETHER HE WANTS FULL OR HALF DUPLEX TELETYPE SERVICE, WE RECOMMEND FULL DUPLEX BECAUSE IT ALLOWS GCL IN DISK SYSTEMS AND HAS MANY USER CONVENIENCES. THE LIBRARY FILE CANNOT BE MADE TO HANDLE HOTH TYPES TO GETHER DEPENDING ON MONGEN ANSWER SO THE DECISION MUST BE MADE THE POLLOWING INSTRUCTIONS OF MADE HAS ASSEMBLY. THE FOLLOWING INSTRUCTIONS

SYSTEM LIBRARY FILE NAME

v 11	4 1	5"XX.REL
v 1 1	4 0	SUXX.REL
111	د ي	5SXX.MEL

(CONT'L)

THE USER MUST DECIDE WHICH OF THE ABOVE THREE FILES HE LISHES TO CHEATE IF HE IS CREATING A NEW LIBRARY; OTHERAISE, HE MAY MERELY DETERMINE THE SYSTEM LESIONATION FOR HIS "EXISTING LIBRARY" FILE FROM THE ABOVE TABLE.

ALTHOUGH IT IS POSSIBLE TO ASSEMBLE, PIP, AND LOAD A MONITUR WITH JUST 2 DECTAPES PLUS A CUSP TAPE THE FOLLOWING DIRECTIONS ASSUME THAT THERE ARE TWO UNITS FOR SOURCES, ONE FOR HINARY, AND ONE SCRATCH TAPE FOR CREF INTERMEDIATE OUTPUT(IF LISTING DESIRED), PLUS THE CUSP TAPE,

MOUNT MONITOR SOURCE TAPE 3 ON UNIT WITH LOGICAL NAME 3 AND MONITOR SOUNCE TAPE 4 ON UNIT WITH LOGICAL NAME 4, MOUNT TAPE TO RECEIVE BINARY FILES ON UNIT WITH LOGICAL NAME RL4, IF YOU HAVE A DISK, COPY S, MAC AND FT----, MAC FROM 3 TO USK USING PIP:

.R PIP

OSK:/X/8+3:S.MAC,FT----,MAC

AND IN THE FOLLOWING ASSEMBLY INSTRUCTIONS SUBSTITUTE DSKIS.FT---- FOR 3:5.FT----

DURING THE ASSEMBLIES, SUBSEQUENT SQURCE TAPES 5,6,14, AND 15 HILL BE SUBSTITUTED FOR 4. HOWEVER SOUNCE TAPE 3 MUST ALWAYS BE PRESENT UNLESS THE FILES S, AND THE DESIRED FT--- FILES ARE COPIED FROM SOURCE TAPE 3 TO SOURCE TAPE 4, 5, 6, 14, AND 15 OR YOU HAVE A DISK, SINCE THEY ARE RE-READ FOR EACH ASSEMBLY, COPYING ALL OF THE OTHER SOURCES ONTO THE DISK REDUCES THE ASSEMBLY TIME FROM 20 MINUTES TO ABOUT 10 MINUTES ELAPSED TIME, SO IT NEED BE DONE ONLY THE USER SHOULD ALTERNATIVELY RUN MACRO AND CREF. OF COURSE IF THE USER DOES NOT WANT A CREF(CROSS-REFERENCE) LISTING, HE MEED ONLY RUN MACRO. HOWEVER, THE INSTRUCTIONS ASSUME THAT A CREF LISTING IS WANTED FOR EACH SUB-PROGRAM OF THE MONITOR. THUS THE PATTERN OF TYPE-IN IS!

```
(CONT D)
```

.R MACHO >

(CONTIC)

COMMON

V11

v11 v11

V11 V11 V11 THE REASON THAT MACRO AND CREF ARE RUN ALTERNATELY, IS TO REDUCE THE AMOUNT OF CREF I TERMEDIATE STORAGE REJURED, IF A USER HAS A MAGHTADE, HE CAN PUT ALL THE CREF INTERMEDIATE ON MAGTAPE MY AUNITION ALL THE ASSEMBLES FIRST, FOLLOWED BY ALL THE CREF'S. THIS MAKES FOR MUCH LESS TYPING, SINCE THERE IS NO NEED TO TYPE COLTROL O FOLLOWED BY A MONITOR COMMAND ON EACH ASSEMBLY, WHEN THE CREF'S ARE MUN THE USER MERELY TYPES CARRIAGE RETURN AS INPUT TO EACH ASSEMBLY OUTPUT USING THE MAGTAPE AS INPUT AND LPT AS OUTPUT.

3.2	. A (1	A 5	STEE	LIBRARY	ETIE	to IT at	910

3.2.1 ORBERING CONSTRAINTS FOR MONITOR LIBRARY FILE AND FOR LOADING

THE ORDERING CONSTRAINTS ON THE MONITOR LIBRARY FILE ARE VERY FEW.

- 3.2.1.1 COMMON MUST BE LOADED FIRST SINCE IT HAS EXTERNAL STATEMENTS TO LOAD THE DESIRED ROUTINES FROM THE REST OF THE
 FILE, IT ALSO HAS THE 140 STARTING LOCATIONS IN IT SO
 IT MUST BE LOADED FIRST. IT SHOULD NOT BE PART OF THE
 LIBRARY FILE (ALTHOUGH IT WILL DO NO HARM IF IT IS.)
 COMMOD SHOULD BE PLACED AFTER COMMON IF IT IS NEEDED.
- 3.2.1.2 ALL THE REGUIRED AND OPTIONAL ROUTINES MAY BE LOADED IN ALY ORDER,
- 3.2.1.3 THE LIBRARY MUST END IN THE FOLLOWING ORDER!
- 3.2.1.3.1 PATCH MUST BE THE FIRST OF THE LAST MOUTINES, BECAUSE IT CONTAINS THE FIRST UNUSED INSTRUCTION IN MONITOR.
- 3.2.1.3.2 MOVIE MUST BE NEXT

V14

- 3.2.1.3.3 SYSMAK MUST BE NEXT
- 3.2.1.3.4 EDGT. IF LOADED. MUST BE NEXT
- 3.2.1.3.5 ONCE AND REFRESHER MUST FOLLOW EDDT SO THAT IT WILL NOT TAKE UP ANY ROOM WHEN EDDT IS DESIRED TO BE AVAILABLE FOR EXEC MODE DEBUGGING (ONCE ONLY DIALOG QUESTION).

V14 THIS REQUIRES ONCHOO V14 REFSTR V14 ONCE IN THAT ONDER, V15 IF ONCE IS NOT LAST, THE MONITOR WILL PROBABLY HALT V15 AFTER DESTROYING THE PROGRAM LOADED AFTER ONCE,

3.2.1.5 KNOWING WHAT THE ORDERING CONSTRAINTS ARE YOU WILL HAVE AN OPPORTUNITY TO DISCOVER SHORT CUTS TO THE ABOVE PROCEDURES. FOR EXAMPLE, IT IS POSSIBLE TO KEEP YOUR OLD LIBRARY FILE AND LOAD A FEW ADDITIONAL AND/OR REPLACEMENT ROUTINES FIRST, SINCE THE GLOBAL REQUESTS WILL BE SATISFIED THE LOADER WILL NGT LOAD THE OLDER LIBRARY ROUTINE, OF COURSE SINCE COMMON MUST BE THE VERY FIRST LOADED ROUTINE, IT MUST PRECEDE ANY OF YOUR ADDITIONAL AND/OR REPLACEMENT ROUTINES.

MONITH, OPR-02 PAGE 060

                 BETICALLY.
```

- 3.3 LOAD MONITOR USING LOADER
 TO LOAD THE MONITOR FOLLOW SECTIONS 2.3.1, THROUGH 2.3.4.
- 3.4 SAVE MODITOR USING MONITOR SAVE COMMAND 3.4.1 TYPE

SAVE STAL XXXMON

WHENE XXXMON IS THE NAME OF YOUR MONITOR.

- 4. PATCHING YOUR MONITOR WITH DUT
 - 4.0 PATCHING COMPONENTS
 - 4.1 PATCHING WITH USER OUT BAUER TIBESHARING
 - 4.2 PATCHING WITH EXEC DOT STAND-ALONE
 - 4.3 PATCHING CONVENTIONS (EITHER DDT).
- 4.0 REQUIRED COMPONENTS
 - 4.2,1 FOR PATCHING WITH USER DDT UNDER TIMESHARING
 - 4.2.1.1 MONITOR ON DECTAPE WHICH WAS LOADED WITH USER DOT (/D SWITCH TYPED TO LOADER.)
- V14
 4.0.1.2 UP TO 38K OF USER CORE AVAILABLE TO A SINGLE USER UNDER TIMESHARING
 - 4.0,1,3 A RUNNING TIME SHARING MOSITOR
 - 4.0.2 FOR PATCHING WITH EXEC DDT OUT OF TIME SHARING
 - 4.0,2,1 MONITOR ON DECTAPE WHICH WAS LOADED WITH EXEC ODT (ANSWER Y TO MONGEN DIALOG)
 - 4.7,2,2 JUST ENOUGH PHYSICAL CORE TO LOAD MONITOR. THIS TAKES LESS CORE THAN PATCHING WITH USER DDT BUT MACHINE CANNOT BE TIMESHARED.

PATCHING WITH USER DOT UNDER TIME SHARING. 4,1

4.1.1 USER DDT IS RECOMMENDED FOR PATCHING OVER EXEC DDT SINGE MACHINE MAY BE TIME SHARED DURING PATCHING PROCESS. (NUTE A COPY OF THE MONITOR IS PATCHING, NOT THE ONE CONTROLLING THE MACHINE.) HOWEVER IT REQUIRES MORE CORE ON YOUR SYSTEM THAN DOES PATCHING WITH EXEC DOT. THERE MUST BE AVAILABLE UP TO 38K OF USER CORE AVAILABLE TO A SINGLE JOB UNDER TIME SHARING IN ORDER TO MAKE THE PATCHES WITH USER DDT. IN ORDER TO MAVE LOADED USER DDT WITH YOUR MONITOR YOU MUST HAVE USED THE YOU SWITCH. IF YOU DID NOT, YOU MUST RELOAD YOUR MONITOR. YOU DO NOT NEED TO GO THROUGH THE MONGEN DIALOGUE AGAIN, HOWEVER, BE SURE TO ALSO SPECIFY THE /S SHITCH SO THAT LOCAL SYMBOLS ARE LOADED. PATCHING WITH-OUT LOGAL SYMBOLS IS NOT RECOMMENDED.

4.1.2 GET COPY OF YOUR MONITOR BY TYPING!

V14 GET DTAN 5545A

V14

TO THE RUNNING TIME SHARING SYSTEM. WHEN THE MONITOR RESPONDS WITH:

JUB SETUP

TYPE:

CUT

WHICH WILL START UP USER DUT.

4.1.3 AFTER ALL FATCHES ARE MADE, TYPE <CONTROL>C, FOLLOWED BY:

V14

SAVE UTAN 55458

BE CAREFUL NOT TO TYPE (CONTROL)C THICE, LEAST YOU RETURN TO MONITOR MODE BEFORE DDT MIGHT MAKE ITS LAST MODIFICATION (SWAPPING SYSTEMS ONLY).

- 4.1.4 YOU MAY SAVE THE PATCHED MONITOR ON THE DISK TOO. SINCE
 THE FORMATS ARE THE SAME IN THE 5 SERIES MONITOR
 BE SURE TO WRITE MONITOR ON DECTAPE USING MONITOR SAVE
 COMMAND RATHER THAN COPYING IT WITH PIP. SINCE THIS
 SAVED FILE MUST BE LOADED WITH TENDMP. ALL SAVED FILES
 WHICH WILL NEVER BE LOADED BY TENDMP MAY BE COPIED BY
 PIP (USING /B SHITCH OF COURSE).
- 4,2 PATCHING WITH EXEC DOT STAND-ALONE
 - 4.2.1 EXEC DDT IS RECOMMENDED ONLY IF YOU DO NOT HAVE ENOUGH CORE FOR PATCHING HITH USER DDT. IT IS ALSO RECOMMENDED THAT ALL PATCHES BE MADE WITH EITHER ONE OR THE OTHER BUT NOT BOTH. THIS IS BECAUSE THE SYMBOL TABLE POINTER BECOMES CONFUSED AND TENDMP HRITES BLOCKS CONSECUTIVELY HICH CAUSES THE TAPE TO ROCK ON A MONITOR GET FOR EACH BLOCK, HOWEVER, SHITCHING CAN BE DONE IF THESE RESTRICTIONS ARE OBSERVED.
 - 4.2.2 IF THE MONITOR TO BE PATCHED WAS PREVIOUSLY PATCHED BY EXEC DDT, THEN PATCHED BY USER DDT, ONE SPECIAL ACTION MUST BE TAKEN BEFORE EXEC DDT WILL BE ABLE TO REFERENCE THE MONITOR SYMBOL TABLE! THE CONTENTS OF ABSOLUTE LOCATION 116 (JDBSYM) MUST BE PLACED IN ABSOLUTE LOCATION 36(DDTSYM) (THE PLACE WHERE DDT EXPECTS TO FIND ITS SYMBOL TABLE POINTER). THIS IS CONVENIENTLY ACCOMPLISHED WITH THE FOLLOWING COMMAND TO EXEC DDT.

MOVE 1165X MOVEM 365X

NOTE: THE FIRST TIME CONTROL WENT TO 141, C(116) IS COPIED TO 36, THEN THE COPY CODE IS OVER WRITTEN.

HONITR.OPR-02 PAGE 065

4.2.3 LOAD THE MONITOR FROM DECTAPE WITH TENDMP, WITHOUT STARTING BY TYPING! LS5543A SAV

FOLLOWED BY CARRIAGE RETURN TO TENDMP.
THEN SPECIFY EXEC DDT STARTING ADDRESS AND START
IT UP BY TYPING!

141\$ G\$

4.2.4 WHEN YOU ARE FINISHED PATCHING, TYPES

77488\$G

TO RETURN TO 32K TENDMP (37400 IF 16K, 137400 IF 48K, ETC.).

4.2.5 SAVE (DUMP) THE MONITOR ON DECTAPE BY TYPING!

V13 V14

V14

1405 D\$55475 SAV

FOLLOWED BY CARRIAGE RETURN TO TENDMP.
WARNING - DO NOT TYPE A PERIOD BETHEEN NAME AND EXTENSICN, BECAUSE TENDMP WILL MAKE IT BE A PART OF NAME, AND
MOLITOR AND CUSPS WILL NOT BE ABLE TO GET FILE.

4.3 PATCHING CORRECTIONS (EITHER DDT)

THE FOLLOWING TECHNIQUES FOR MONITOR PATCHING ARE PART CONVENTION AND PART NECESSITY; IT IS WELL TO FOLLOW THEM CAREFULLY.

- 4.3.1 EXEC DDT BEHAVES ALMOST EXACTLY LIKE USER DDT AS DESCRIBED 14 THE DDT MANUAL (DEC-10-CODA+D). THE USER SHOULD BE THOROUGHLY FAMILIAR WITH THIS DOCUMENT BEFORE TRYING TO USE EXEC DDT. EXEC DDT IS ENTERED BY STARTING THE MACHINE AT, OR TRANSFERRING TO, ABSOLUTE LOCATION 141 IN ALL MORITORS. THIS MAY BE ACCOMPLISHED THROUGH COMMANDS TO TENUMP OR BY MEANS OF THE CONSOLE SWITCHES,
- 4.3.2 ALWAYS PATCH A FRESHLY LOADED COPY OF THE MONITOR ONE WHICH HAS NOT YET RUN THROUGH THE INITIALIZATION DIALOGUE.
- 4.3.3 LOADED INTO EACH MONITOR IS A BLOCK OF PATCHING SPACE BEGINNING AT GLOBAL LOCATION PATCH, BY CONVENTION, THE VALUE OF THIS SYMBOL IS NOT CHANGED WHEN PATCHES ARE MADE; INSTEAD, ANOTHER SYMBOL, PAT, IS REDEFINED BY THE USER AFTER EACH PATCH SO AS TO POINT AT ALL TIMES TO THE NEXT FREE LOCATION IN THE PATCHING AREA. THUS, THE VERY FIRST PATCH IN ANY SYSTEM WILL BEGIN AT SYMBOLIC LOCATION PATCH; ALL SUBSEQUENT PATCHES WILL BE MADE STATTING AT SYMBOLIC LOCATION PATCH; ALL SUBSEQUENT PATCHES WILL BE CHANGED TO POINT TO THE NEXT FREE LOCATION AS THE LAST STEP IN MAKING ANY GIVEN PATCH. BY THIS MEANS, THE NEXT PERSON TO PATCH THE MONITON WILL BE ABLE TO FIND THE PATCHING SPACE.
- 4.3.4 SUGGESTED PATCHES ARE DISTRIBUTED IN A NOTATION CONSISTENT HITH THE ABOVE MECHANISM. EVERYTHING THE USER MUST TYPE TO EXEC DDT IS INCLUDED IN THE SUGGESTED PATCH INCLUDING THE DDT COMMAND WHICH UNLOCKS THE PROPER SET OF LOCAL SYMBOLS.
- 4.3.5 THE TIME SHARING MONITORS BEGIN TO ALLOCATE FREE CORE FOR VARIOUS INTERNAL FUNCTIONS JUST ABOVE THE LAST PATCH LOCATION IN USE. FOR THIS REASON IT IS VERY IMPORTANT THAT, AS A LAST STEP IN ANY PATCHING SESSION, THE USER INFORM THE MONITOR OF HOM MUCH ADDITIONAL PATCH SPACE WAS USED, OTHERWISE, THIS SPACE HILL BE ALLOCATED AND THE PATCHES WILL BE DESTROYED. THE USER SHOULD HAVE REDEFINED LOCATION PAT AS THE FIRST FREE LOCATION; THIS HAVING BEEN DONE, IT IS ONLY NECESSARY TO OPEN LOCATION PATSIZ (LOCATION ONCE+1 IN OLDER MONITORS) AND RETYPE ITS CONTENTS

MOVEL TAC.PAT

(4,3 CONTID)

4.3.6 IT IS CONSIDERED GOOD PRACTICE TO CHANGE THE NAME OF A
LVERY TIME IT IS PATCHED, FOR EXAMPLE, 5.18A MIGHT
V14

RECORE 5.18B WHEN PATCHED FOR THE SECOND TIME, IF ALL
APPLICABLE DEC-RELEASED PATCHES THROUGH LEVEL X HAVE
REE APPLIED, THEN IT IS OUR CONVENTION TO NAME THE FIELD
V14

IMAGE MONITOR 5.18X, THE NEW NAME SHOULD BE ENTERED AS
7 SIT ASCII TEXT IN LOCATION CONFIG (AND THE SEVERAL
LOCATIONS WHICH FOLLOW - UP TO 24 CHARACTERS).

MOTE: IF THE NAME IS A MULTIPLE OF 5 CHARACTERS LONG.
MAKE SURE THE NEXT WORD CONTAINS A ZERO TO DELIMIT THE
TEXT STRING. LIKEWISE, THE SYSTEM DATE IN LOCATION
SYSDAT AND SYSDAT+1 SHOULD BE UPDATED (IN 7 BIT ASCII TEXT).

- 4.3.7 NEVER SAVE A MONITOR WHICH HAS ALREADY BEEN RUN, AS IT WILL BE USELESS FOR RELOADING. IF THE SYSTEM IS ACCIDENTLY . RU! BEFORE SAVED, START AGAIN WITH A FRESH COPY AND RE! AKE THE PATCHES.
- 4.3.0 INSTRUCTIONS AND AN EXAMPLE FOR PATCHING THE MONITOR.

 THE TIME TO MAKE PATCHES IS AFTER THE MONITOR HAS
 FEEN LOADED BUT BEFORE IT HAS BEEN RUN. IN ORDER TO PATCH,

 IT IS DECESSARY TO HAVE A COPY OF EXEC MODE DOT LOADED
 WITH THE MONITOR. IF YOUR SAVED VERSION OF THE
 MONITUR DOES NOT CONTAIN DOT, YOU MUST REPEAT THE MONGEN
 DIALOG AND RELOAD YOUR MONITOR AND ANSWER YES TO THE
 GUESTIONS
 LOAD EXEC DOT?

AND
LUCAL SYSBOLS?
SINCE BOTH ARE NECESSARY FOR PATCHING THE MONITOR. IT IS
FOSSIBLE TO PATCH WITHOUT LOCAL SYMBOLS, BUT IT IS NOT
RECOMMENDED. DISTRIBUTED PATCHED WILL ASSUME LOCAL SYMBOLS.

(4,3,8 CONT'D)

THE PATCHES THEMSELVES ARE GIVEN IN THE FORMAT OF DOT TELETYPE DIALOGUE. THE LOCATIONS ARE RENAMED BY THEIR SYMBOL NAMES. IF A USER DOES NOT HAVE LOCAL SYMBOLS LOADED, HE SHOULD REFER TO HIS MONITOR STORAGE MAP AND LISTING TO TRANSLATE LOCAL SYMBOLS TO GLOBAL SYMBOLS AND LITERALS. THE FIRST COMMAND IN EACH GROUP IS THE COMMAND TO UNLOCK THE LOCAL SYMBOL TABLE IN THE NAMED ROUTINE.

NOTE: & IN THIS SECTION STANDS FOR THE ALTHODE KEY TTY GUTPUT TAB AND DOT NOW MAY REFERENCE THE SYMBOL TABLE OF THE EX: USER TYPES CDRSR6\$1 ROUTINE CORSRO.

AT THE END OF THE MONITOR IS A SPACE OF ABOUT 300(8) AT THE END OF THE MUNITUR IS A SMACE OF ABOUT SECTOR
LOCATIONS WHICH IS RESERVED FOR MONITOR PATCHES. THIS
PATCH BUFFER BEGINS AT GLOBAL LOCATIONS PATCH. TO INSERT
A PATCH WITHIN A MONITOR ROUTINE, THE PROCESS IS TO BEGIN AND THEN TO WRITE THE PATCH BEGINVING AT LOCATION PATCH. THE LAST INSTRUCTION IN THE PATCH SHOULD BE A JRST BACK TO THE MONITOR.

IN THE ROUTINE BAH YOU HOULD LIKE TO CHANGE FROM EX: BAH21 JFCL HRRS 0.0 TO JFCL ADDI 9,0 HRRS 9,0 BAH21 FMPR 1.1

FMPR 1,1

IN UDT YOU WOULD GIVE THE COMMAND

WHICH UNLOCKS THE LOCAL SYMBOLS IN BAH BAHS:

THEN TYPE BAH2+1/

WHICH OPENS AND TYPES OUT THE CONTENTS OF BAH2+1

THE TTY THEN OUTPUTS (TAB) HRRS 0.0 (TAB) YOU HOULD THEN TYPE IN

JRST PATCH(TAB) THE TAB CLOSES THE LOCATION BAH2+1 WHICH IS NOW MODIFIED AND OPENS LOCATION

(4.3.8 CONT'D)

TTY RESPONSE IS PATCH/ (TAB) W(TAB) YOU THEN INSERT

ADDI 3.0 (LINE FEED)

LINE FEED CLOSES THE LOCATION AND OPENS THE NEXT ONE

TTY OUTPUTS PATCH+1/(TAB)@(TAB)

YOU INSERT HRRS M, E(LINE FLED)

TTY DUTPUTS PATCH+2/(TAB)@(TAB)

YOU INSERT JRST BAH2+2(LINE FEED)

TTY OUTPUTS! PATCH+3/(TAB)@(TAB)

YOU INSERT

PAT: (CARRIAGE RETURN)
(THIS RENAMES THE CURRENT LOCATION WITH
GLOBAL SYMBOL PAT

THE ENTIRE DIALOGUE WOULD LOOK LIKE THE FOLLOWING!

HRRS 0,0 JRST PATCH BAHS! BAH2+1/ PATCH/ Ø PATCH+1/ Ø ADDI 8.8 HRRS 8.8 JRST BAH2+2 PATCH+2/ & PATCH+3/ B PATE

THIS LAST STEP IS QUITE IMPORTANT, THE GLOBAL PATCH ALWAYS POINTS TO THE BEGINNING OF THE PATCH AREA. ONLY THE FIRST PATCH IN THIS AREA HILL BEGIN AT LOCATION PATCH, AFTER EACH PATCH IS MADE. THE FIRST UNUSED LOCATION SHOULD BE RENAMED PAT. THIS IS NECESSARY TO DETERMINE WHERE SUCCESSIVE PATCHES SHOULD BEGIN.

(4,3,8 CONTID)

WHEN THE PATCHING SESSION IS COMPLETE, THE GLORAL LOCATION PATSIZ SHOULD THEN BE OPENED AND SHOULD BE ALTERED THUS

FATSIZ/ MOVEL X.Y MOVEL TAC, PAT

THIS INFORMS THE MONITOR WHERE THE CURRENT END OF THE PATCHES IS. A COMMON ERROR TO FURCET THIS STEP, WHICH WILL CAUSE THE MONITOR TO LOOP WHEN STARTED UP INSTEAD OF RUNNING THE NULL JOB, THIS IS BECAUSE THE MONITOR WILL HAVE CREATED COPIES OF MULTIPLE DEVICE DATA BLOCKS ON TOP OF YOUR PATCH. IN ADDITION, THE GLOBAL LOCATIONS CONFIG AND SYSDAT SHOULD BE UPDATED TO IDENTIFY THE NEW MONITOR VERSION AND DATE OF UPDATE.

V14 EX: CONFIGS7T/ 527D "/527E/

\$77 IS A COMMAND TO PRINT THE CONTENTS OF THE PRECEDING ADDRESS AS A 7 BIT ASCII CHARACTER.

" MEANS INSERT THE ASCII TEXT FOLLOWING THE / IN THE CURRENT OPENED LOCATIONS TERMINATING THE TEXT WITH THE SECOND /.

V14 ALSO SYSDAT\$77/ 01-01 "/04-31/ V14 SYSDAT+1\$77/ -64 "/-70/

THIS ALSO COMPLETES THE PATCHING PROCESS. AT THIS POINT THE MONITOR IS READY TO RUN. IT SHOULD NOT BE STARTED, HOWEVER, UNTIL A COPY WITH THE PATCHES IS SAVED ON A DECTAPE FOR FUTURE RELOADING.

AS AN AID TO PATCHING, IN THE DISTRIBUTED PATCH RELEASES, USER INPUTS TO THE TTY ARE IN LOWER CASE! DOT OUTPUT IS IN UPPER CASE.

```
CRASH PROCEDURES IN MONITOR 55,01
6.
               THERE IS A NEW, EASIER CRASH PROCEDURE IN MONITOR 35.91. IT IS DOCUMENTED IN MONGSP, MAN BUT MANY PEOPLE HAVE NOT SEEN IT. IT IS IMPERATIVE THAT CRASHES BE TAKEN CORRECTLY, ESPECIALLY NOW THAT CRASHES ARE OCCURRING SO INFREQUENTLY. THE NEW PROCEDURE SAVES THE HARDWARE STATE OF THE MACHINE, INCLUDING PC. ALL IO

END OF "MONITR.OPR"

SYSTAT MONITOR COMMAND 8.

THE MONITOR COMMAND SYSTAT CAUSES A CUSP TO BE RUN WHICH PRINTS STATUS INFORMATION ABOUT THE SYSTEM, IT MAY EVEN BE TYPED WHEN THE USER IS NOT LOGGED-IN, THUS ALLOWING THE USER TO DETERMINE THE LOAD ON THE SYSTEM BEFORE LOGGING-IN, SOME INSTALLATIONS MAY CONSIDER THE SYSTAT INFORMATION PROPRIETARY, IN WHICH CASE THEY SHOULD CHANGE THE PROTECTION OF THE SAVE FILE (SYSTAT, SAV) ACCORDINGLY, SO THAT ONLY OPERATIONS PEOPLE MAY USE IT. 8.1 USE IT.

TO DÍVERT THE SYSTAT OUTPUT TO THE LINE PRINTER, ASSIGN THE LPT AND GIVE IT LOGICAL NAME SYSTAT. TO WRITE THE OUTPUT ON THE DISK AS A FILE WITH NAME SYSTAT.TXT, ASSIGN DEVICE DSK AND GIVE IT LOGICAL NAME SYSTAT.

THE BEST WAY TO DESCRIBE THE SYSTAT OUTPUT IS WITH AN EXAMPLE:

Status of 55.0016 LEVEL D at 11:59:11 on 08-May-70

Uptime 01:19:07, 7% Null time = Idle+Lost = 1% + 6%

System FT|estructures: DSKA.DSKB.DSKC. TITLE LINE - THE NAME OF SYSTEM AS SPECIFIED IN MONGEN DIALOG QUESTION AND PATCHED AS ASCII TEXT IN LOCATIONS CONFIG... CONFIG+4, FOLLOWED BY THE TIME OF DAY AND THE DATE.

CPU USAGE - THE NUMBER OF HOURS, MINUTES, AND SECONDS SINCE SYSTEM WAS LOADED INTO CORE, 140 AND 143 RESTARTS DO NOT RESET THIS QUANTITY TO ZERO. THE PERCENT OF UP TIME THAT SYSTEM WAS RUNNING THE NULL JOB. NULL TIME IS DIVIDED INTO TWO CATEGORIES, IDLE AND LOST, THE IDLE TIME IS THE PERCENT OF UPTIME THAT NO JOB WANTED TO RUN, I.E., ALL JOBS WERE HALTED OR WERE IN A WAIT FOR SOME DEVICE, THE LOST TIME IS THE PERCENT OF UPTIME THAT THE NULL JOB WAS RUNNING BUT AT LEAST ONE OTHER JOB WANTED TO RUN (I.E., WAS NOT WAITING FOR A DEVICE) BUT COULD NOT BE RUN BECAUSE OF ONE OF THE FOLLOWING CAUSES:

- 1. BEING SWAPPED OUT
 2. BEING SWAPPED IN
 3. ON DISK WAITING TO BE SWAPPED IN
 4. MOMENTARILY STOPPED SO DEVICES CAN BECOME INACTIVE IN ORDER TO SHUFFLE JOB IN CORE.

IN A SENSE THE IDLE TIME RATHER THAN ALL OF NULL TIME REPRESENTS THE EXCESS CAPACITY OF THE SYSTEM WHICH CAN BE ABSORBED BY ADDING MORE USERS, THE LOST TIME CANNOT BE USED UNLESS THE JOB MIX IS CHANGED..

JOB DESCRIPTION:

EACH JOB WHICH IS LOGGED-IN HAS THE FOLLOWING INFORMATION TYPED ABOUT ITSELF:

- 1. JOB NUMBER (JOB)
 1A. IF THE JOB HAS A HIGH SEGMENT WHICH HAS BEEN
 SUPERCEDED, AN EACH SIGN (*) IS PRINTED AFTER THE JOB NUMBER.
 - 1B. IF THE JOB IS USING A HIGH SEGMENT WHICH IS FROM A DIRECTORY OR DEVICE OTHER THAT THE CUSP DIRECTORY ON DEVICE SYS, A NUMBER SIGN (#) IS PRINTED AFTER
- THE JOB NUMBER.

 2. PROJECT—PROGRAMMER NUMBER OF THE USER (WHO). IF THE USER HAS DETACHED HIS TTY FROM THE JOB, **, ** IS PRINTED INSTEAD SO THAT ANOTHER USER CANNOT ATTACH TO THE DETACHED JOB. FOR THE OPERATOR AND THE USER HIMSELF, THE NUMBER IS PRINTED.
- PRINTED.

 FELETYPE NUMBER (WHERE), CTY MEANS CONSOLE TELETYPE, DET
 MEANS THE TELETYPE HAS BEEN DETACHED FROM THE JOB,
 PROGRAM NAME (WHAT) AS SET BY THE GET, R,RUN COMMANDS AND
 THE LOADER CUSP (SETNAM UUO), IT IS USUALLY THE LOW SEGMENT NAME.
- PROGRAM SIZE (SIZE) IN THOUSANDS (K=1024 WORDS) OF WORDS, JOB STATE AND SWAPPED STATE (STATE)
- - USER HAS TYPED CONTROL C, JOB HAS HAD ERROR OR EXITED. TELETYPE IO WAIT

 - DI

 - TELETYPE IO WAIT
 DISK 10 WAIT
 IO WAIT FOR ANY OTHER DEVICE
 RUNNING (MAYBE SWAPPED OUT OR ON WAY AS WELL AS IN CORE)
 WAIT SATISFIED
 DISK HAIT SATISFIED
 SYSTEM TAPE WAIT
 ALTER UFD WAIT
 MONITOR BUFFER WAIT
 DISK ALLOCATION WAIT
 DISK CORE BLOCK SCAN WAIT
 DECTAPE CONTROL WAIT
 - WS
 - TS
 - DS
 - ST
 - AU
 - MQ
 - DA
 - CB
 - DECTAPE CONTROL WAIT ĎT
 - DC
 - DATA CONTROL WAIT MAGTAPE CONTROL WAIT PROGRAM IS SLEEPING

 - SW LOW SEGMENT IS SWAPPED OR ON WAY IN OR OUT SWF LOW SEGMENT IS SWAPPED OR ON WAY IN OR OUT AND BECAUSE SWAPPING SPACE IS NEAR FULL THE LOW SEGMENT IS FRAGMENTED ON THE DISK.
- 7. JOB RUN TIME (RUNTIME) SINCE LOGGED IN.

HIGH SEGMENTS

EACH HIGH SEGMENT CURRENTLY IN AT LEAST ONE JOB'S VIRTUAL ADDRESSING SPACE HAS THE FOLLOWING INFORMATION TYPED OUT!

- HIGH SEGMENT NAME (PROGRAM), IF THE HIGH SEGMENT IS NOT SHARABLE, THE UNLIKELY NAME (PRIV) FOR PRIVATE IS TYPED, IF THE HIGH SEGMENT HAS BEEN SUPERCEDED, THE UNLIKELY NAME (OBS) FOR OBSOLETE IS TYPED.
- DEVICE OR FILE STRUCTURE FROM WHICH THE SEGMENT CAME.
- DIRECTORY NAME (OWNER) FROM WHICH THE HIGH SEGMENT CAME, IF ONE OF THE JOBS USING THE HIGH SEGMENT IS DETACHED AND THE PROJECT-PROGRAMMER NUMBER OF THE HIGH SEGMENT IS THE SAME AS HIS, **.** IS SUBSTITUTED TO FURTHER PROTECT THE USER FROM HAVING HIS DETACHED JOB ATTACHED TO BY SOMEONE ELSE.
- SIZE OF HIGH SEGMENT (HIGH K) IN THOUSANDS OF WORDS (K=1024 WORDS).

 4A. IF HIGH SEGMENT IS SWAPPED OUT AND IS NOT IN CORE,
- 4A. IF HIGH SEGMENT IS SWAPPED OUT AND IS NOT IN COME.

 SW IS PRINTED,

 4B. IF HIGH SEGMENT IS SWAPPED OUT AND
 IS NOT IN CORE AND IS FRAGMENTED, SWF IS PRINTED,

 4C. IF HIGH SEG IS IN CORE BUT IS FRAGMENTED ON DISK
 TOO, F IS PRINTED,

 5. NO OF USERS IN WHOSE VIRTUAL ADDRESSING SPACE THE HIGH SEGMENT APPEARS.

DORMANT SEGMENTS:

EACH SHARABLE HIGH SEGMENT WHICH IS CURRENTLY NOT IN ANY JOB'S VIRTUAL ADDRESSING SPACE HAS THE FOLLOWING INFORMATION TYPED

- 1. HIGH SEGMENT NAME (PROGRAM)
- 2. DEVICE NAME FROM WHICH IT CAME.
- DIRECTORY NAME (OWNER) FROM WHICH THE HIGH SEGMENT CAME
- SIZE OF HIGH SEGMENT (HIGH K) IN THOUSANDS OF WORDS (K=1024 WORDS), 4A. IF HIGH SEGMENT IS SWAPPED OUT AND IS NOT IN CORE, SW IS PRINTED.
 - IF HIGH SEGMENT IS SWAPPED OUT AND IS NOT IN CORE.
 - AND IS FRAGMENTED, SWF IS PRINTED,
 IF HIGH SEGMENT IS IN CORE BUT IS FRAGMENTED ON THE
 DISK TOO, F IS PRINTED,

PERCENT SHAPPING SPACE USED BY ACTIVE AND DORMANT HIGH AND LOW SEGMENTS IS COMPUTED BY TAKING THE RATIO OF K OF SHAPPING SPACE USED DIVIDED BY THE TOTAL K PREALLOCATED AT REFRESH TIME FOR SHAPPING (EACH HIGH SEGMENT IS ONLY COUNTED ONCE). THIS STATISTIC GIVES THE SYSTEM ADMINSTRATOR SOME INFORMATION FOR DETERMINING THE OPTIMUM AMOUNT OF SHAPPING SPACE TO ASSIGN, TOO MUCH SWAPPING SPACE WASTES DISK SPACE, WHILE TOO LITTLE SPACE CAN CAUSE BAD FRAGMENTATION (HENCE SLOWER SWAPPING) OR EXHAUSTION OF VIRTUAL CORE,

PERCENT VIRTUAL CORE USED BY ACTIVE HIGH AND LOW SEGMENTS IS COMPUTED BY TAKING THE RATIO OF K OF VIRTUAL CORE USED (EACH HIGH SEGMENT IS ONLY COUNTED ONCE NO MATTER HOW MANY USERS ARE SHARING AND DORMANT SEGMENTS ARE NOT COUNTED AT ALL) DIVIDED BY THE TOTAL K PREALLOCATED AT REFRESH TIME FOR SHAPPING, THIS PERCENTAGE CAN BE HIGHER OR LOWER THAN THE PERCENT OF SHAPPING SPACE USED. THE SHAPPING RATIO IS A MEASURE OF HOW MANY TIMES PHYSICAL CORE IS EXCEED BY THE TOTAL SIZE OF ALL JOBS IN SYSTEM, THE SHAPPING RATIO IS COMPUTED BY TAKING THE RATIO OF K OF VIRTUAL CORE USED BY ACTIVE HIGH AND LOW SEGMENTS TO THE SIZE OF USER CORE, EACH ACTIVE HIGH SEGMENT IS ONLY COUNTED ONCE AND DORMANT SEGMENTS ARE NOT COUNTED AT ALL).

IF PHYSICAL CORE EXCEEDS THE CURRENT USAGE, THE NUMBER OF κ of core left is reported instead.

THE PERCENT OF VIRTUAL CORE SAVED BY SHARING IS COMPUTED BY SUMMING THE NO. OF K IN ACTIVE HIGH SEGMENTS MULTIPLIED BY THE NUMBERS OF JOBS MINUS ONE USING THE HIGH SEGMENT AND DIVIDING BY THE SUM OF THAT SAME QUANTITY PLUS THE TOTAL VIRTUAL CORE USED.

BUSY DEVICES:

- i. DEVICE NAME (DEVICE)
- 2. JOB NUMBER USING THE DEVICE (DJOB)
- 3. HOW DEVICE IS ASSIGNED (WHY)

ASSIGNED BY CONSOLE ASSIGN COMMAND - AS ASSIGNED BY PROGRAM (INIT OR OPEN UUC) - INIT ASSIGNED BOTH WAYS - AS+INIT

SYSTEM FILE STRUCTURES:

EACH FILE STRUCTURE KNOWN TO THE SYSTEM IS PRINTED.

SELECTED OUTPUT:

OFTEN A USER IS ONLY INTERESTED IN PART OF THE OUTPUT, ANY SUBSET OF THE OUTPUT MAY BE SELECTED BY TYPING ONE OR MORE SINGLE LETTERS AS AN ARGUMENT TO THE SYSTAT COMMAND, THE LETTERS MAY BE TYPED IN ANY ORDER, THE LETTERS ARE BDFHJS

- B JUST BUSY DEVICES
 D DORMANT SEGMENTS
 F FILE STRUCTURES
 H EVERYTHING EXCEPT JOB INFORMATION
 J JUST JOB INFORMATION
 S SHORT JOB PRINTOUT STATE AND RUN TIME ARE NOT PRINTED

EXAMPLE

SYSTAT BD PRINTS BUSY DEVICES AND DORMANT SEGMENTS.

SUBJECT:

FAILSAFE VERSION 27

DATE: JUNE 10, 1970

TOI

FROM: C. MCCOMAS

THE INFORMATION IN THIS MEMORANDUM IS SUBJECT TO CHANGE WITHOUT NOTICE AND SHOULD NOT BE CONSTRUED AS A COMMITMENT BY DIGITAL EQUIPMENT CORPORATION,

FAILSAFE VERSION 27

FAILSAFE VERSION 27 AND ALL LATER VERSIONS ARE DESIGNED TO RUN ONLY WITH THE LEVEL D MONITOR, AND ARE INCOMPATIBLE WITH PRECEDING MONITOR LEVELS.

FAILSAFE VERSION 27 DIFFERS FROM FAILSAFE VERSION 16 (THE LAST LEVEL C RELEASE) IN THE FOLLOWING RESPECTS.

1) THE TAPE FORMAT IS DIFFERENT. THE NEW FORMAT IS AS FOLLOWS:

HEADER RECORDS (FOLLOWED BY EOF)

XWD VER,4 SIXBIT/*FAILS/ XWD <SIXBIT/AFE/>,<TAPE #> USUAL FORM OF CREATION TIME & DATE XWD 1,2

WHERE VER THE POSITIVE VERSION# OF THE FAILSAFE USED TO MAKE THE TAPE

LAST RECORD OF LAST FILE ON EACH TAPE IS A TRAILER RECORD WHICH IS IDENTICAL TO THE HEADER ON THAT TAPE, EXCEPT WORD 3 RIGHT HALF = -TAPE #.

USER AREA FILES ARE ROUGHLY JUST AS BEFORE EXCEPT THAT INSTEAD OF EACH USER HAVING JUST ONE FILE ON THE TAPE CONTAINING ALL HIS DISK FILES, HE NOW HAS ONE FILE FOR EACH DISK STRUCTURE ON WHICH HE HAS FILES.

EXAMPLE OF ARRANGEMENT OF USERS ON TAPE:

DSKA [1,1] (DSKA UFD'S)
DSKA [1,4]
DSKA [10,10]
DSKA [1,2]
DSKB [1,1] (DSKB UFD'S)
DSKB [1,4]
DSKB [10,10]
DSKB [10,14]
DSKB [1,2]
DSKB [1,2]
DSKB [1,2]

WITHÍN EACH DISK STRUCTURE USER AREA THE FILES ARE THE SAME FORMÁT AS BEFORE EXCEPT THAT THE OLD 4 WORD BLOCK IN THE FIRST RECORD OF EACH FILE HAS BEEN EXPANDED FROM THE OLD 4 WORD DIRECTORY ENTRY LOOKUP TO THE NEW 32 WORD EXTENDED LOOKUP ENTRY, IT NOW LOOKS LIKE THIS:

FIRST RECORD OF FILE!

XHD =1,N SIXBIT/STRUCTURE NAME/ 32 USER AREA PROJ-PROG# SIXBIT/FILNAM/ XHD<SIXBIT/EXT/>,ACC, DATE PROT, MODE, CREAT, DATE 26 MORE WORDS OF LOOKUP INFO, FIRST 745 DATA WORDS OF THE FILE UFD'S ARE NOW SAVED, BUT ONLY THE LOCKUP INFO, IS SAVED FOR UFD FILES, NO DATA WORDS ARE SAVED FOR UFD'S, THE 1,1 AREAS CONTAIN ONLY UFD'S & ARE THE FIRST AREA FOR EACH STRUCTURE.

THOSE FILES MARKED BY THE MONITOR AS "DO NOT FAILSAFE" FILES (SAT.SYS, BADBLK.SYS, ETC) ARE NOT SAVED.

2) ALL VERSION 27 COMMANDS ARE THE SAME AS IN VERSION 16. EXCEPT AS FOLLOWS:

75 SAVES ALL STRUCTURES

SDSKA, DSKC, DPA6 SAVES ONLY THOSE STRUCTURES & DEVICES NAMED.

JU SAVES ALL OF THE USER'S AREAS

JUDSKB SAVES JUST USER'S AREAS ON NAMED STRUCTURES.

A MAX, OF 16 ARGS MAY BE USED AFTER /S OR /U.

RESTORE COMMANDS WORK AS FOLLOWS!

IF POSSIBLE EACH FILE IS RESTORED TO THE STRUCTURE IT CAME FROM. IF THIS IS NOT POSSIBLE, AN ATTEMPT IS MADE TO RESTORE THE FILE TO SOME OTHER STRUCTURE, THE ONE WITH THE MOST ROOM IF POSSIBLE.

THE NEW /G COMMAND HAS BEEN INCLUDED. THIS ENABLES THE USER TO RUN THE /U AND /L COMMANDS FOR A USER OTHER THAN HIMSELF. THE FORMAT IS */GMMM,NNN<C,R,>
THIS CHANGES THE SINGLE-USER PROJECT-PROGRAMMER NUMBER SHITCH FROM THAT OF THE FAILSAFE USER (THE VALUE IT HAS INITIALLY) TO MMM,NNN. THIS NEW VALUE IS RETAINED UNTIL THE NEXT /G COMMAND.

3) OTHER CHANGES IN THE OPERATION OF FAILSAFE!

FAILSAFE DOES NOT CHANGE THE ACCESS DATE OF FILES WHICH IT SAVES OR RESTORES,

ON RESTORING WITHOUT THE /N SWITCH, FAILSAFE DOES NOT OVERWRITE EXISTING DISK FILES WHICH HAVE THE SAME CREATION DATE AND TIME AS A CORRESPONDING FILE ON TAPE.

4) TO RESTORE OLD FORMAT TAPES USE R FAILCD (A RESTORE ONLY FAILSAFE FOR RESTORING LEVEL C TAPES TO A LEVEL D DISK).

100-170-018-00

FLOW CHART FOR /R FOLLOWS:

R9:

LON	OHAN PON PIN DEEDHOU
R:	READ UFD INFO FROM TAPE IF SOURCE FILE STR. NO LONGER EXISTS, GO TO R5 IF THIS UFD DOES NOT EXIST ON THIS STR., GO TO R3
R2:	IF NEXT FILE WILL NOT FIT IN EXISTING QUOTA, ERROR OTHERWISE GO TO R4
R3:	CREATE A UFD ON THIS STR. WITH ORIGINAL QUOTA
R4:	RESTORE FILE TO THIS STR. (IF IT FITS) IF STR. OVERFLOWS, GO TO R6 OTHERWISE GO TO R2
R5:	IF THIS UFD DOES EXIST IN SOME OTHER FILE STR, GO TO RE
R6:	IF NO OTHER STRUCTURE EXISTS, ERROR CHOOSE EMPTIEST STRUCTURE IN SYSTEM CREATE UFD WITH INFINITE QUOTA
R7:	RESTORE NEXT FILE (IF IT FITS) IF STR. OVERFLOWS, GO TO R6 OTHERWISE GO TO R7
R8:	IF NEXT FILE DOES NOT FIT IN QUOTA, GO TO R9 RESTORE FILE (IF IT FITS) IF STR, OVERFLOWS, GO TO R9 OTHERWISE GO TO R8

IF THIS UFD DOES NOT EXIST IN ANY OTHER STR., ERROR OTHERWISE GO TO R8

FAILSAFE DOCUMENTATION CHANGES

(CHANGES TO CHAPTER 5, SYSTEM MANAGER'S GUIDE, NOTEBOOK 3)

PAGE

5-1 CHANGE +SAT+,SYS TO SAT,SYS

DELETE "EXCEPT UFD'S" ON /S

ADD PRIMARY FUNCTION /M (AUTOMATICALLY REPEAT LAST SAVE FUNCTION AT STATED INTERVALS)

ADD 7G (ENABLE /U, /L, & SELECTIVE RESTORE OF AN AREA DIFFERENT FROM THE USER'S)

5-2 THE TAPE FORMAT HAS CHANGED AS ABOVE.

USRCTD BIT IS NOT USED

5=17 72 SETS MTA DENSITY TO 200 BPI (INSTEAD OF /Z)

```
*** FOR MORE EFFICIENT USE OF FAILSAFE ***
```

WHEN RESTORING AFTER REFRESHING THE DISK, USE THE /N SWITCH TO SPEED THINGS UP. E.G., */N/R THIS AVOIDS DOING A LOOKUP FOR EACH FILE.

NOTES ON RUNNING FAILSAFE FOR THE NON-[1,2] USER

1) TO SAVE ALL HIS FILES ON A TAPE

.AS MTA# FAILSA .R FAILSĀ */U

2) TO LIST THE NAMES OF HIS FILES ON A FAILSAFE TAPE

.AS MTA# FAILSA
.R FAILSA (DIRECTORY GOES TO TTY)
*/L

.AS MTA# FAILSA
.AS DSK LST
.R FAILSA
*/P (DIRECTORY GOES TO DSK:FAILSA,DIR)

3) TO RESTORE SOME OF HIS FILES TO DISK

,AS MTA# FAILSA .R FAILSA ++,+ (RESTORES ALL FILES)

OR

*NAME, * (RESTORES ALL FILES WITH NAME "NAME" BUT ARBITRARY EXTENSION)

OR

**.EXT (RESTORES ALL FILES WITH EXTENSION "EXT" - BUT ARBITRARY NAME)

OR

*FIL.1, FiL, 2, FIL, 3 (RESTORES SPECIFIED FILES)

SUBJECT:

FAILCD VERSION 6

DATE: MAY 27, 1970

TOI

FROM: C. MCCOMAS

THE INFORMATION IN THIS MEMORANDUM IS SUBJECT TO CHANGE WITHOUT NOTICE AND SHOULD NOT BE CONSTRUED AS A COMMIT-MENT BY DIGITAL EQUIPMENT CORPORATION.

FAILCD VERSION 6

(ESSENTIALLY THE SAME AS VERSION 1)

FAILCD IS A RESTORE ONLY FAILSAFE FOR RESTORING OLD FORMAT FAILSAFE TAPES (VERSION 16 & EARLIER) TO A LEVEL D SYSTEM.

ALL FAILSAFE VERSION 16 COMMANDS ARE AVAILABLE EXCEPT:

/S. /U. /M. AND /K

OPERATION IS THE SAME AS FAILSAFE VERSION 16.

THE NEW /G COMMAND HAS BEEN INCLUDED. THIS ENABLES THE USER TO RUN THE /U AND /L COMMANDS FOR A USER OTHER THAN HIMSELF, THE FORMAT IS */GMMM,NNN<C.R.>
THIS CHANGES THE SINGLE-USER PROJECT-PROGRAMMER NUMBER SHITCH FROM THAT OF THE FALLSAFE USER (THE VALUE IT HAS INITIALLY) TO MMM,NNN, THIS NEW VALUE IS RETAINED UNTIL THE NEXT /G COMMAND.

LEVEL C PROTECTION CODES ARE CHANGED TO LEVEL D PROTECTION CODES AS FOLLOWS:

PROTECTION	LEVEL D PROTECTION
Ø	Ø
1	5
2	7
2 3	7
4	1
5	5
6	2
7	7

FILES WITH PROJECT-PROGRAMMER NUMBER 1,1 ARE RESTORED (BY BOTH /R & SELECTIVE RESTORE) TO THE 1,4 AREA.

SUBJECT:

FAILDC VERSION 4

DATE: MAY 27, 1970

TO:

FROM: C. MCCOMAS

THE INFORMATION IN THIS MEMORANDUM IS SUBJECT TO CHANGE WITHOUT NOTICE AND SHOULD NOT BE CONSTRUED AS A COMMIT-MENT BY DIGITAL EQUIPMENT CORPORATION,

(ESSENTIALLY THE SAME AS VERSION 1) FAILDC VERSION 4

FAILDC IS A SAVE ONLY FAILSAFE FOR SAVING LEVEL ODISK FILES ON MAGNETIC TAPE IN THE OLD FORMAT (COMPATIBLE WITH FAILSAFE VERSION 16 & EARLIER).

ALL FAILSAFE VERSION 16 COMMANDS ARE AVAILABLE EXCEPT:

AND SELECTIVE RESTORE

OPERATION IS THE SAME AS FAILSAFE VERSION 16.

THE NEW /G COMMAND HAS BEEN INCLUDED. THIS ENABLES THE USER TO RUN THE /U AND /L COMMANDS FOR A USER OTHER THAN HIMSELF, THE FORMAT IS */GMMM,NNN<C.R.>
THIS CHANGES THE SINGLE-USER PROJECT-PROGRAMMER NUMBER SWITCH FROM THAT OF THE FAILSAFE USER (THE VALUE IT HAS INITIALLY) TO MMM,NNN. THIS NEW VALUE IS RETAINED UNTIL THE NEXT /G COMMAND.

LEVEL D PROTECTION CODES ARE CHANGED TO LEVEL C PROTECTION CODES AS FOLLOWS:

LEVEL D PROTECTION	LEVEL C PROTECTION
2	Ø
1	4
2	4
2 3	4
4	4
5	5
6	5 .
7	Ø

ALL FILES IN THE 1.4 AREA ARE SAVED (BY BOTH /S & /U) WITH PROJECT-PROGRAMMER NUMBER 1.1.

BOOTS
Level D Disk Bootstrap
Program Description

Revision Date: 10 June 70 Author: R. Clements

Introduction

BOOTS is a bootstrap program for use with the Tevel D disk service of the PDP-10 timesharing monitor. BOOTS has two main functions:

- 1) Loading a program into core from a disk SAVE file; and
- 2) Dumping core out as a SAVE file (for later analysis of a crashed monitor),

BOOTS runs In EXEC mode, of course, and is loaded into the top 1K of core. Due to the lack of READ-IN mode for the various disk controllers, BOOTS is usually loaded from paper tape.

Operations

The operation of BOOTS is as follows:

- 1) Load paper tape of BOOTS into paper tape reader.
 2) Set READ-IN DEVICE switches to 184, press STOP,
- RESET, READIN,

 3) When paper tape has been read, BOOTS starts and types a carriage return,

 4) Type in command string, terminated by carriage
- return.

 5) After performing the command, BOOTS either restarts
 Itself, or transfers to the newly loaded program, as appropriate for the command.

Command string format:

The general form of a BOOTS command is:

STRUCTURE: FILE, EXTEPROJ, PROGJ/SWÍTCH

For any fleids not supplied, defaults are assumed. The SWITCH fleid determines what operation is to be performed, the STRUCTURE fleid is a flie structure name within the disk flie system, NOT a physical device name.

Available operations:

- 1) No switch means find the specified file, clear core, read the file into core, set the PROGRAM START ADDRESS as specified by the file, and start at that address. I.e., load and run the program. The default FILE name is SYSTEM, SAV.
- 2) /L = means do ail of the above, Including setting the PROGRAM START ADDRESS, except do not start the loaded program. I.e., Load the program, Default FILE name is SYSTEM.SAV.
- 3) 7D means find the specified file, write out core (from location 20 through the base of BOOTS) onto the file, and write the current PROGRAM START ADDRESS onto the file, i.e., Dump core,

NOTE THAT THE SPECIFIED FILE MUST ALREADY EXIST! It is updated, not created. The file, when read, will not have correct checksums. The default file name is CRASH, SAV.

- 4) In m where MnM is an octal number m means set the PROGRAM START ADDRESS to n, This command should be used prior to dumping core if the program is to be loaded and run by BOOTS in the future. (This is not necessary for dumping system crashes.)
 - 5) /G = means Go to the current PROGRAM START ADDRESS.

BOOTS - Level D Disk Bootstrap - 100-470-002-00 PAGE 4 10 June 70

Defaults:

The default STRUCTURE: Is DSK: (see "search technique" below),

The default FILE is SYSTEM, except for the /D operation, where it is CRASH.

The default .EXT is .SAV (a blank extension may be specified by explicitly typing the dot with no extension following it).

The default [PROJ, PROG] is [1,4].

The default /SWITCH is "none", i.e., a load and run command.

Search fechnique

BOOTS searches for a specific file structure (e.g., DSKB) by looking for all possible disks in a predetermined order. That order is: FHAØ, FHA1, ..., FHA3, FHBØ, ..., FHB3. DPAØ, ..., DPA7, DPBØ, ..., DPB7. Note that these devices are searched for a structure name written on the device, not for their physical names, BOOTS will not find device DPAØ, for example.

The only exception to the rule that the STRUCTURE: requested must be a defined file structure is the special case of DSK1 (or blank) as a structure name. In this case, BODTS will search for the file on structures DSKA1, DSKB1, DSKC1, ..., DSKO1, in that order. As a consequence of this, the common case of dumping a crash on CRASH, SAV would attempt to write the file on DSKA since each structure normally has a file called CRASH, SAV, If the crash is desired on DSKB, (because DSKB is larger, for example), then the DSKB1 must be explicitly typed.

Note that the LEVEL D monitor does not require disk structures to be named DSKA; DSKB; etc. Those are only recommendations. Nothing prevents an installation from creating file structures called SAM; and IRVING: However, BOOTS would only find such a structure if its name were explicitly typed; BOOTS will not find it in the default structure DSK; because IRVING: is not in BOOTS's default definition of DSK; (The LEVEL D monitor would find IRVING; in DSK; since the monitor is smarter than BOOTS;)

Core allocation:

BOOTS may be assembled for any size of core. When running, it occupies the top 1000 octal words of the core for which it was assembled. It uses all of the next lower 1000 words as buffers, except for the region from 0 to 137 in that 1000 words, which might be a job's JOB DATA AREA under a crashed monitor, and thus might be needed for analyzing a dump.

The starting address of BOOTS is 1000 below the top of core. For example, 64K BOOTS starts at 177000,

Recapitulation:

To dump a crashed system on DSKB:CRASH,SAV[1,4], type DSKB:/D

To run a fresh monitor from DSK:SYSTEM,SAV[1,4], type just carriage return,

LOOKFL . MEM

VØ01 JUNE 18 7Ø LOOKFL IS A PROGRAM WHICH DOES AN EXTENDED LOOKUP ON A FILE AND PRINTS OUT ALL THE ARGUMENTS. WHEN IT TYPES

FILE: .TYPE $\bar{\text{I}}\text{N}$ A FILE NAME AND RETRIEVE YOUR LISTING FROM DEVICE LPT (FILE NAME LOOKFL,TXT).

FILE NAME HAS FORM DEVINAME, EXT[PROJ, PROG]. UFD'S MAY BE SPECIFIED.

GRIPE.MEM

VØØ1 JUNE 18 7Ø GRIPE IS A PROGRAM WHICH READS TEXT FROM ITS USER AND RECORDS IT IN A DISK FILE, THIS ENABLES USERS TO RECORD COMMENTS AND COMPLAINTS. TO RUN IT, RUN GRIPE, WHEN IT TYPES YES? TYPE ANY TEXT YOU WISH TERMINATED BY AN ALTMODE, THE TEXT IS WRITTEN AS FILE CMP###.CMP (### IS A RANDOM NUMBER), CURRENTLY IN THE 3,3 AREA, IT ALSO HAS A HEADER INCLUDING THE DATE AND TIME AND USER WRITING THE COMMENT,

DATDMP.MEM

VØØ1 JUNE 18 7Ø CODE HAS BEEN ADDED TO DATDMP TO ALLOW A SUBSET OF ITS LISTING TO BE PRINTED. IN USER MODE, IT TYPES * AND WAITS FOR THE SUBSET DESIRED TO BE TYPED IN. SUBSET MAY BE FILE.EXT[PROJ.PROG] TO LIST ENTRIES FOR FILE.EXT [PROJ.PROG]. ANY OR ALL MAY BE *, BUT IF ANY FILE IS SPECIFIED AND NO PPN IS SPECIFIED, THE USER'S PPN IS ASSUMED. IF NO FILES OR EXTS ARE SPECIFIED, ALL FILES FOR PPN'S SPECIFIED WILL BE LISTED. CARRIAGE RETURN GIVES THE WHOLE LISTING (I.E. *.*[*,*]).

FOR THOSE PPN'S SPECIFIED, PPB AND UFD BLOCKS ARE PRINTED, AND FOR FILES SPECIFIED, NMB BLOCKS AND ACCESS TABLES ARE PRINTED, THUS, *,MACCIØ,*] LISTS ALL PPB'S AND UFB'S FOR ALL PROGRAMMERS IN PROJECT 10 WHO CURRENTLY HAVE PPB'S AND GIVES NMB BLOCKS AND ACCESS TABLES FOR ALL FILES WITH EXTENSION MAC FOR THOSE PROGRAMMERS.

IN EXEC MODE, SET LOCATIONS PPNTST, NAMTST, AND EXTTST FOR THE DESIRED SUBSET.

PPNTST CONTAINS PPN'S DESIRED, WITH Ø FOR *.

NAMIST CONTAINS SIXBIT NAME TO CHECK, WITH Ø FOR *.

EXTIST CONTAINS @ FOR * OR, IF NON-ZERO, RH=SIXBIT EXT TO CHECK,

THESE LOCATIONS ARE CLEARED AFTER EACH DUMP SO THAT THEY MUST BE RESET EACH TIME.

DSKRAT, MEM

VØ01 JUNE 18 7Ø DSKRAT IS A DAMAGE ASSESSMENT PROGRAM FOR LEVEL D DISK FILE STRUCTURES. IT SCANS THE FILE STRUCTURE, USING SUPER USETI'S TO READ FILES AND REPORTS ANY INCONSISTENCIES DETECTED TO DEVICE LPT (FILE NAME RAT.LST IF LPT IS A DIRECTORY DEVICE).

TO RUN DSKRAT, LOG IN AS 1,2 (REQUIRED FOR SUPER USETI), ASSIGN A FILE STRUCTURE LOGICAL NAME STR, ASSIGN LPT IF YOU WISH IT TO BE SOME DEVICE OTHER THAN THE PRINTER, AND RUN DSKRAT. DSKRAT OPENS STR AND LPT, READS SAT BLOCKS INTO CORE AND IF EVERYTHING IS ACCEPTABLE TYPES "RUNNING" AND BEGINS TO SCAN THE FILE STRUCTURE.

FOR EACH FILE ON THE FILE STRUCTURE, DSKRAT LOOKS UP THE FILE AND REPORTS ANY FAILURES, READS AND VERIFIES THE FIRST RIB OF THE FILE. CHECKSUMS EACH GROUP AND REPORTS ERRORS, READS THE RETRIEVAL INFORMATION FROM THE RIB AND CONSTRUCTS ITS OWN SAT BLOCKS. IF THERE ARE ANY DISAGREEMENTS BETHEEN SATS READ FROM DISK AND SATS CONSTRUCTED BY DSKRAT, ERROR MESSAGES ARE OUTPUT; I.E. IF ANY CLUSTER IS IN MORE THAN ONE FILE, OR IN A FILE BUT NOT MARKED IN THE SAT, THAT FACT IS REPORTED, IDENTIFYING THE CLUSTER AND THE FILE TO WHICH IT BELONGS. ONE LINE IS PRODUCED FOR EACH ERROR, INCLUDING THE FILE NAME, CLUSTER NUMBER AND LOGICAL BLOCK NUMBER OF THE CLUSTER IN QUESTION, AND AN ERROR COMMENT.

WHEN DSKRAT HAS GONE COMPLETELY THROUGH THE FILE STRUCTURE, IT PRINTS A LIST OF CLUSTERS IN MORE THAN ONE FILE, CLUSTERS IN FILES BUT NOT MARKED IN SATS, AND CLUSTERS MARKED IN SATS BUT NOT IN ANY FILE, THEN, IF ANY CLUSTERS ARE IN MORE THAT ONE FILE, IT TYPES

"END OF PASS 1, BEGINNING PASS 2"

AND STARTS OVER, THE SECOND PASS WILL PRODUCE AN ERROR LINE FOR EVERY FILE CLAIMING CLUSTERS USED BY MORE THAN ONE FILE (OBVIOUSLY THE FIRST SUCH FILE IS NOT KNOWN IN PASS 1 UNTIL THE SECOND IS FOUND), IF YOU DO NOT WANT PASS 2, TYPE CONTROL C TWICE AND REENTER. THIS WILL CLOSE LPT AND EXIT,

IF NO CLUSTERS ARE IN MORE THAN ONE FILE, IT TYPES

"END OF PASS 1, NO NEED FOR PASS 2"

AND EXITS.

NOTE THAT SINCE DSKRAT READS IN SATS AT THE BEGINNING OF THE PROGRAM, IF OTHER USERS ARE REFERENCING THE DISKS (HRITING OR DELETING FILES OR READING FILES MARKED FOR DELETION) THE SAT BLOCKS HILL NOT BE CURRENT AND YOU WILL GET SPURIOUS ERRORS, HOWEVER, TRUE ERRORS WILL NOT BE MISSED.

FILEX IS A GENERAL FILE TRANSFER PROGRAM. INTENDED TO CONVERT RETWEEN VARIOUS CORE IMAGE FORMATS AND TO READ AND WRITE VARIOUS DECTAPE DIRECTORY FORMATS, AS WELL AS STANDARD DISK FILES.

THE COMMANDS TO FILEX ARE SIMILAR TO A PIP COMMAND STRING. FILES ARE TRANSFERRED AS 36-BIT BINARY DATA. NO PROCESSING IS DONE ON THE DATA ITSELF, EXCEPT THAT NECESSARY TO CONVERT BETWEEN VARIOUS CORE IMAGE REPRESENTATIONS.

RAPID TAPE PROCESSING, VIA A DISK SCRATCH FILE, IS AVAILABLE.

"WILD=CARD" FILE NAMES (*) ARE PERMITTED.

DEVICE FORMATS AVAILABLE:

NON-DECTAPE DEVICES ARE READ AND WRITTEN IN BINARY. DEVICE, FILE-NAME, EXTENSION, PROJECT-PROGRAMMER NUMBER, AND PROTECTION ARE SUPPLIED IN THE USUAL WAY.

DECTAPES IN THE USUAL POPIØ DIRECTORY FORMAT MAY BE READ OR WRITTEN IN BINARY IN THE USUAL WAY, AND THEY MAY BE READ VIA A DISK SCRATCH FILE, WHICH IS MUCH FASTER FOR EITHER A TAPE WITH MANY FILES, OR A TAPE WHICH HAS BEEN WRITTEN BY TENDMP (WITH CONSECUTIVE BLOCKS ALLOCATED TO THE SAME FILE.)

SIMILARLY, DECTAPES MAY BE READ, WITH OR WITHOUT USE OF A SCRATCH FILE, AND MAY BE WRITTEN, IN EITHER THE OLD DEC PDP+6 DECTAPE FORMAT, OR THE MIT PROJECT MAC PDP6/10 DECTAPE FORMAT, FOR BOTH OF THESE FORMATS, THE MONITOR'S DECTAPE SERVICE ROUTINE CANNOT BE MADE TO RUN EFFICIENTLY, SO THE SCRATCH FILE TECHNIQUE IS ADVISED, THE /O (OLD) AND /M (MAC) SWITCHES SPECIFY THESE FORMATS, /T (TEN) RETURNS TO PDP10 FORMAT TAPES.

DATA FORMATS AVAILABLE:

UNLESS ONE OF THE FOLLOWING SPECIAL FORMATS APPLIES, ALL FILES ARE TRANSFERRED UNMODIFIED, AS 36-BIT BINARY DATA.

CORE IMAGE FILES ARE THE SPECIAL CASES HANDLED, PROCESSING IS AVAILABLE TO CONVERT FROM ANY OF THE FOLLOWING FORMATS TO ANY OTHER OF THEM. (OF COURSE, IF THE INPUT AND OUTPUT FORWATS ARE IDENTICAL, THE FILE IS SIMPLY COPIED.)

EACH OF THE FOLLOWING CORE IMAGE FORMATS IS INDICATED BY SPECIFIC EXTENSIONS, WHICH MAY BE OVERRIDDEN BY SWITCHES.

- 1) SAVE-FILE FORMAT: ASSUMED FOR FILES WITH EXTENSIONS .SAV, .LOw, AND .SVE, CAN BE FORCED BY THE /C SWITCH (COMPRESSED CORE IMAGE.) THE DEFAULT OUTPUT EXTENSION FOR A /C
 FILE IS .SAV.
- 2) EXPANDED CORE IMAGE FILE (AS USED BY FILDDT): ASSUMED FOR FILES WITH EXTENSION XPN. CAN BE FORCED BY THE /E SWITCH (EXPANDED). THE DEFAULT OUTPUT EXTENSION FOR A /E FILE IS XPN.
- 3) DUMP FORMAT (OLD PDP6 VERSION OF SAVE): ASSUMED FOR FILES WITH EXTENSION .DMP. CAN BE FORCED BY THE /D SWITCH.
- 4) SBLK FORMAT (SIMPLE BLOCK-PROJECT MAC'S EQUIVALENT OF DEC'S ,SAV FORMAT)! NOT ASSUMED FOR ANY EXTENSION, BUT IS FORCED BY THE /S SWITCH, THE DEFAULT OUTPUT EXTENSION FOR A /S FILE IS .BIN.
- 5) THE /B SWITCH CAUSES BINARY PROCESSING EVEN THOUGH A FILE FILE HAS ONE OF THESE SPECIAL EXTENSIONS.

COMMANU FORMAT:

- A FILEX COMMAND IS OF THE FORM:
 - * OUTPUT SPECIFIER * INPUT SPECIFIER(S)
 - + OUTPUT SPECIFIER = INPUT SPECIFIER(S)

OUTPUT SPECIFIER IS:

REVI NAME .EXT [P,PN]<PROT>/S OR ...(S(1)S(2)S(3))
WHERE /S INDICATES ANY SWITCH

INPUT SPECIFIER IST

DEV: NAME .EXT [P.PN]/S, ... OR DEV: [P.PN]/S NAME .EXT, NAME? .EXT, ...

IF THE [F,PN] AND/OR /S APPEAR AFTER A DEVICE, THEY APPLY TO ALL FOLLOWING FILES. IF THEY APPEAR AFTER A FILE NAME, THEY APPLY ONLY TO THAT FILENAME.

THE INPUT NAME OR EXT MAY BE *, IN WHICH CASE THE USUAL WILD-CARD PROCESSING OCCURS.

THE OUTPUT NAME OR EXT MAY BE . IN WHICH CASE THE NAME OR EXT OF THE INPUT FILE IS COPIED.

IF THE DUTPUT NAME OR EXT ARE MISSING, ALMOST THE SAME OCCURS AS FOR . EXCEPT THAT ALL CORE IMAGE FILES WILL BE WRITTEN WITH THE DEFAULT EXTENSION AND FORMAT APPROPRIATE TO THE OUTPUT DEVICE (UNLESS OVERRIDDEN BY SWITCHES). THAT IS,:

*DSK: *DTA1: FOO.DMP/O WOULD CAUSE

THE DMP FORMAT FILE TO BE COMPRESSED /C AND WRITTEN AS FOO.SAV.

TO CAUSE AN INPUT DECTAPE TO BE PROCESSED QUICKLY (VIA A SCRATCH FILE). USE THE /Q SWITCH (FOR QUICK).

TO CAUSE THE /Q PROCESSING AND PRESERVE THE SCRATCH FILE AFTER PROCESSING, FOR USE BY ANOTHER COMMAND, USE THE /P (PRESERVED DUICK) SWITCH,

TO REUSE A SCRATCH FILE PRESERVED BY /P IN A PREVIOUS COMMAND, USE THE /R (RE-USE) SWITCH.

to ignore read errors on the input device, use the $\ensuremath{\text{/}}$ (go on) switch.

FILEX CHECKS THE ALWAYS-BAD-CHECKSUM BIT IN THE LEVEL D DISK FORMAT, SO /G IS NOT NEEDED FOR THOSE FILES WITH .RPABC ON (E.G. CRASH, SAV),

TO COPY A CRASH, SAV TO AN EXPANDED FORMAT FILE FOR FILDDT TO EXAMINE, TYPE (FOR EXAMPLE):

DSKI SER105.SAV[10,10]/E+DSKCI CRASH.SAV[1,4]

WHILE LOGGED IN AS (1.2) (TO BE ABLE TO READ CRASH, SAV, WHICH IS READ-PROTECTED BY THE REFRESHER).

THE /2 SWITCH ON AN OUTPUT FILE, IF IT IS A DECTAPE, GAUSES THE APPROPRIATE FORMAT OF ZEROED DIRECTORY TO BE WRITTEN ON THE TAPE. IF THE STRING

+TAPE ID

APPEARS IN THE OUTPUT SPECIFIER, THEN TAPEID IS WRITTEN AS THE TAPE IDENTIFIER IN THE DIRECTORY, TAPEID MAY BE 6 CHARRACTERS ON A PROJECT MAG TAPE, AND IS NOT PRESENT ON A PDP6 TAPE.

THE /L SWITCH ON AN INPUT DECTAPE FILE CAUSES THE TAPE DIRECTORY TO BE TYPED ON THE TTY. (DO NOT PUT TTY! IN THE OUTPUT FILE SPECIFIER. THAT WOULD TRY TO WRITE FILES ON THE TTY IN BINARY.)

SUMMARY OF FILEX SWITCHES

SWITCH MEANING

DEFAULT EXTENSION

- 1. DEC TAPE FORMAT SPECIFIERS
 - M MAC

 - 0 OLD, PDP=6 T TEN; NORMAL PDP=10 DIRECTORY FORMAT
- 2. FILE FORMAT SPECIFIERS
 - 3 HINARY, OVERRIDES DEFAULT EXTENSION C COMPRESSED; SAVED FILE FORMAT SAV

LOW

- DMP XPN BIN
- D CUMP: OLD PDP=6 E EXPANDED: FOR FILDOT S SBLK: PROJECT MAC'S SAVE
- 3. DEC TAPE PROCESSING SWITCHES
 - G GO ON! IGNORE READ ERRORS

 - L LIST; TYPE DIRECTORY ON TTY
 P PRESERVEDI Q PLUS KEEP FILE
 Q QUICK; USE SCRATCH FILE FOR DIRECTORY
 R REUSE; SCRATCH DIRECTORY FROM P
 Z ZERO; DECTAPE DIRECTORY
 +N(1),,,N(6)= SPECIFY TAPE IDENTIFIER

QUOLST, MEM

JULY 1 1970 V061 QUOLST IS A PROGRAM WHICH TYPES ON DEVICE TTY ITS USER'S QUOTAS (RESERVED, FIRST COME FIRST SERVED, AND LOGGED OUT), AND BLOCKS FREE WITH RESPECT TO LOGGED IN QUOTA (RESERVED + FIRST COME FIRST SERVED). ONLY THOSE FILE STRUCTURES CURRENTLY IN THE FILE STRUCTURE SEARCH LIST ARE CHECKED.

PLEASE

FUNCTION
THE PLEASE COMMAND IS AVAILABLE TO PROVIDE NON-CONFLICTING
COMMUNICATION BETWEEN AN OPERATOR AND SYSTEM USERS VIA TTYØ.
USE OF THE PLEASE COMMAND IS PREFERRED TO "TALK OPR" BECAUSE
PLEASE PREVENTS SIMULTANEOUS TRANSMISSION TO THE OPERATOR
VIA TTYØ.

1. USER INTERFACE

FOR THIS DESCRIPTION LET \$ REPRESENT <aLTMODE> and LET * REPRESENT ANY ARBITRARY TEXT EXCLUDING CONTROL CHARACTERS. THE OPERATION OF PLEASE FOLLOWS:

USER TYPES: PLEASE *<CR>
SYSTEM RESPONDS: A) OPERATOR HAS BEEN NOTIFIED OR B) OPERATOR BUSY, HANG ON PLEASE

ÎN CASE A THE USER MAY IMMEDIATELY BEGIN TWO-WAY TTY COMMUNICATION WITH THE OPERATOR, COMMUNICATION IS TERMINATED WHEN EITHER END TYPES \$. IF THE OPERATOR IS BUSY THE USER MAY ELECT TO WAIT FOR A MESSAGE AT WHICH TIME HE MAY COMMUNICATE WITH THE OPERATOR, HOWEVER, HE MAY TYPE +C OR \$ TO ABORT AND RETURN TO MONITOR MODE,

PLEASE, MEM

2. OPERATOR INTERFACE

TTYE AT THE COMPUTER SITE MUST BE DEDICATED TO THE USE OF THE PLEASE FUNCTION. ON TTYE THE OPERATOR RECEIVES JOB IDENTIFYING INFORMATION AND THE USER'S MESSAGES AND TRANSMITS HIS RESPONSES.

THE RASIC FORM OF A PLEASE CONVERSATION AS IT APPEARS TO THE OPERATOR IS SHOWN BELOW:

PREAMBLE
JOB IDENTIFYING INFORMATION
PLEASE*
CONVERSATION
TERMINATING MESSAGE

THE JOB IDENTIFYING INFORMATION IS PRESENTED AS:

JOBN EPROJECT#, PROGRAMMER#3 TTYN T1 T2

THAT IS, THE INITIATING JOB NUMBER, PROJECT PROGRAMMER NUMBER AND TELETYPE, TI IS THE TIME THE USER TYPED HIS PLEASE REQUEST, WHEREAS TZ IS THE TIME THE OPERATOR RECEIVED THE REQUEST.

WHEN EITHER PARTY TYPES <ALT-MODE> THE CONVERSATION PORTION TERMINATES, AND THE TERMINATING MESSAGE "FINISHED 13" IS TYPED TO THE OPERATOR. TO IS NATURALLY THE TIME WHEN TRANSMISSION TERMINATES.

FILE(UMOUNT) - INTRODUCTION

THE FILE COMMAND PROVIDES REMOTE CONTROL OF DECTAPE TO DISK AND DISK TO DECTAPE TRANSFERS ON OPERATOR HANDLED DECTAPES. THIS COMMAND ALLOWS DECTAPE TO BE USED AS CONVENIENT BACKUP STORAGE FOR A SMALL DISK SYSTEM. THE COMMAND IS IMPLEMENTED IN THE UMOUNT CUSP. THE USER REQUESTS FILEING OF DATA ONTO DECTAPE, AND RECALLING DATA FROM DECTAPE, BY USING THE FILE COMMAND.

THE USER DESCRIBES THE OPERATION HE WISHES PERFORMED, AND THEN IS FREE TO DO OTHER WORK WHILE THE OPERATOR HANDLES THE TAPE OPERATIONS. HE CAN CHECK ON THE PROGRESS OF HIS REQUESTS, BUT IS NOT SPECIFICALLY INFORMED WHEN THE REQUESTS ARE COMPLETED.

THERE ARE SIX OPERATIONS WHICH CAN BE PERFORMED VIA THE FILE COMMAND: F, Z, R, L, D AND C, THESE ARE DESCRIBED BELOW. THE OTHER ARGUMENTS REQUIRED BY THE FILE COMMAND ARE TAPE ID'S AND FILENAMES, THE TAPE ID IS THE IDENTIFICATION NUMBER OF THE ROLL OF DECTAPE TO BE USED. THIS IS USUALLY A NUMBER (STARTING AT 1 FOR EACH USER), BUT MAY BE A SHARED TAPE, DESCRIBED BY A LETTER AND A NUMBER: FOR EXAMPLE, "A123" MIGHT BE A TAPE SHARED BY ALL USERS.

FILENAMES ARE THE USUAL NAME AND EXTENSION PAIR FOR DISK AND DECTAPE FILES. THE "*" CONVENTION IS ALSO A LEGAL NAME OR EXTENSION: FOR EXAMPLE, *, MAC MEANS "ALL FILE WITH EXTENSION MAC".

UMOUNT.MEM PAGE 2

1. OPTIONS OF THE FILE COMMAND

 F (FOR FILE) OPTION: THIS OPTION IS A REQUEST TO FILE IN-FORMATION ON DECTAPE. IT TAKES A TAPE ID AND A LIST OF FILENAMES AS ARGUMENTS.

EXAMPLE:

FILE F,1, TEST.MAC, DATA,BIN

IS A REQUEST TO PUT THE FILES TEST, MAC AND DATA, BIN ONTO THE USER'S DECTAPE NUMBER 1. AT THE COMPLETION OF THE FILE OPERATION, AN AUTOMATIC FILE D (DIRECTORY) COMMAND WILL BE PERFORMED (SEE BELOW). ALTHOUGH A USER COULD LOGOUT AFTER A FILE REQUEST AND EXPECT THE PROCESS TO GO TO COMPLETION (IF HE SAVED THE FILES DURING THE LOGOUT DIALOGUE). THE PRACTICE IS NOT RECOMMENDED, BECAUSE THE FILES WILL NOT BE DELETED FROM THE DISK.

VØ23 VØ23

- 2) Z (ZERO) OPTION: THIS OPTION IS IDENTICAL TO THE F (FILE) OPTION, EXCEPT THAT THE DIRECTORY OF THE DECATAPE WILL BE CLEARED (ZEROED) BEFORE THE FILES ARE COPIED, AGAIN, A FILE D COMMAND WILL BE PERFORMED AFTER THE FILES ARE COPIED.
- 3) R (RECALL) OPTION: THIS OPTION IS A REQUEST TO RECALL INFORMATION FROM DECTAPE TO THE DISK, THE ARGUMENTS ARE THE SAME AS FOR THE F AND Z OPTIONS, AGAIN, A FILE D COMMAND WILL BE PERFORMED AFTER THE FILES ARE TRANSFERRED.

EXAMPLE:

FILE F,1, *.*

IS A REQUEST TO RESTORE ALL FILES FROM THE USER'S DECTAPE NUMBER 1.

(1 CON'T)

4) L (LIST DIRECTORY) OPTION: THIS OPTION IS A REQUEST TO READ THE DIRECTORY OF A DECTAPE. THE D OPTION REQUIRES ONLY ONE ARGUMENT, THE DECTAPE TAPE ID,

EXAMPLE

FILE D.2

IS A REQUEST TO READ THE DIRECTORY OF THE USER'S TAPE NUMBER 2. THE DIRECTORY WILL BE PLACED IN THE USER'S DISK AREA AS AN ASCII FILE WITH THE NAME TAPEID.DIR, WHERE TAPEID IS THE NAME OF THE USER'S DECTAPE. THUS, IN THE ABOVE EXAMPLE, THE USER MAY READ THE DIRECTORY FOR TAPE 2 BY THE MONITOR COMM+AAND:

TYPE 2.DIR

à directory option is performed at the completion of each ${\bf f}$, ${\bf Z}$, or ${\bf R}$ option.

- 5) D (DELETE) DELETES FILES MENTIONED FROM DECTAPE.
- 6) C (CHECK) OPTION: THIS OPTION CAUSES THE QUEUE OF FILE COMMANDS TO BE READ TO DETERMINE WHETHER ANY OF THE USER'S REQUESTS ARE STILL PENDING. IF NONE ARE PENDING, THE MESSAGE "NONE PENDING" IS TYPED. IF THERE ARE SOME REQUESTS PENDING, THEY WILL BE LISTED. THIS OPTION DOES NOT USE ANY TAPE OR FILE ARGUMENTS. THE CURRENT POSITION IN THE QUEUE OF EACH REQUEST IS TYPED AT THE BEGINNING OF THE LINE DESCRIBING THAT REQUEST.

EXAMPLE:

FILE C

2. DIALOGUE FORM

IF THE FILE COMMAND IS EXECUTED WITHOUT AN ARGUMENT, A BRIEF DIALOGUE WILL BE PERFORMED. THIS MAY BE EASIER FOR A BEGINNER TO FOLLOW. AN EXAMPLE FOLLOWS:

,FILE C, D, F, R OR ₹ (? FOR HELP) •F TAPE ID: 1 FILES: A, B, C REQUEST STORED

OPERATOR REQUIRMENTS 1,

1,1, HARDWARE ENVIRONMENTS

OPERATION OF THE FILE-RECALL SYSTEM REQUIRES

A) A DEDICATED DECTAPE DRIVE

B) A CONTROLLING TTY

- C) DISK FILE STORAGE OF SOME TYPE

1,1, STARTUP

THE OPERATOR LOGS IN UNDER (1,2) ON AN AVAILABLE LOCAL TTY AND ASSIGNS ANY PARTICULAR DECTAPE DRIVE SAY 2, TO BE USED BY THE FILE-RECALL SYSTEM. HE TYPES R OMOUNT AND STARTUP IS COMPLETE.

2, OPERATION

USER REQUESTS ARE STACKED AS ASCII COMMAND FILES UNDER 3,3,UFD WITH ORDER OF RECEIPT (AND HENCE EXECUTION) INDICATED BY THE COMMAND FILE NAMES; E.G., FIL1.CMD,FIL2.CMD,... THE PROGRAM OPFILE READS THESE REQUESTS IN ORDER, COMMUNICATING WITH THE OPERATOR ON THE CONTROLLING TTY,

A TYPICAL MESSAGE FROM OPFILE IS OF THE FORM!

PLEASE MOUNT TAPE # FOR USER ### ON DRIVE:

(2. CONT'D)

THE OPERATOR RETRIEVES THE SPECIFIED DECTAPE
MOUNTS IT UPON THE PREVIOUSLY
ASSIGNED DRIVE AND COMMANDS OPFILE TO PROCEDE BY TYPING THE
DRIVE NUMBER TERMINATED BY A CARRIAGE RETURN (IN THIS CASE, 2).
OPFILE REPLIES WITH THE CURRENT ASCII COMMAND FILE AND SIGNIFIES
COMPLETION OF THE FILE-RECALL OPERATION WITH AN APPROPRIATE
MESSAGE.

3. UNUSUAL ACTIONS

OMOUNT INFORMS THE OPERATOR OF ANY ERRORS OCCURRING WHILE TRANSFERRING FILES, THE OPERATOR MAY REPEAT THE GURRENT FILE OPERATION BY RESTARTING OMOUNT OR MAY DISCARD THE CURRENT REQUEST BY TYPING:

+C .REENTER

AT THE TIME WHEN OMOUNT IS WAITING FOR A DRIVE #, THE OPERATION WOULD APPEAR AS FOLLOWS: PLEASE MOUNT TAPE # FOR USER #,# ON DRIVE: +C

REENTER

WHEN +C, REENTER IS RECEIVED IN THIS FASHION OPFILE RESPONDS BY PRINTING THE DISCARDED COMMAND LINE AND AN APPROPRIATE IDENTIFYING MESSAGE.

MONSUP.MAN PAGE 1

- 1.0 DC10E HANDLER
- 1.1 BACKGROUND

THIS SPECIFICATION DESCRIBES THE INITIAL IMPLEMENTATION OF THE DC10E DATASET-CONTROL SERVICE ROUTINE, AND ITS REQUIRED HARDWARE ENVIRONMENT. THIS ROUTINE IS INTENDED AS THE NECESSARY LEVEL OF SOFTWARE SUPPORT FOR EARLY DC10E'S. FEATURES DESCRIBED HERE WILL BE EXPANDED UPON IN LATER WORK IN THE LOCAL COMMUNICATIONS SOFTWARE PROJECT.

- 1.2 HARDWARE ENVIRONMENT
- 1,2,1 THIS ROUTINE WILL SUPPORT UP TO FOUR DC10E DATASET HANDLERS ON A DC10 DATALINE SCANNER, EACH LINE TO BE CONNECTED TO THE DC10E IS ASSUMED DO BE A BELL-SYSTEM

(1.2.1 CONT'D)

103A DATASET, OR ITS EQUIVALENT.

- 1.2.2 THE AUTOMATIC-DIALLER FEATURES OF THE DC10E ARE NOT SUPPORTED.
- 1.2.3 LINE-NUMBERS OF THE EQUIPMENT MUST BE ASSIGNED AS FOLLOWS:
- 1.2.3.1 THE FIRST LINE-GROUP(S) ON THE DC10 (LINES 0-7, 10,17, ETC.) ARE ASSIGNED TO DC10B 8-LINE GROUPS.
- 1.2.3.2 DC18E EXPANDED DATASET CONTROLS ARE ASSIGNED TO THE NEXT LINE GROUPS IMMEDIATELY ABOVE THE DC18B'S.
- 1.2.3.3 ANY SPARE LINE GROUPS WILL BE THE REMAINING HIGHESTNUMBERED LINES (XØ-77).
- 1.2.3.4 THE ASSOCIATION BETWEEN THE DC100 LINE NUMBER BY WHICH THE DATA IS PASSED, AND TAG DC100 LINE NUMBER BY WHICH THE SUPERVISION OF THE DATASET IS MAINTAINED, IS ARBITRARY, THIS ASSOCIATION IS SPECIFIED BY THE CUSTOMER TO THE MONITOR VIA THE MONGEN PROGRAM, AND IS RETAINED BY THE MONITOR IN A TABLE IN SUB-ROUTINE COMMON, THE PHYSICAL NAME "TTYN" OF THE LINE IS DETERMINED BY THE DC100 LINE NUMBER.
- 1.2.4 EACH LINE OF THE DC10E AND ASSOCIATED DC10B SHALL BE WIRED AS FOLLOWS: (REFERENCE THE DC10 TECHNICAL MANUAL DEC-10-18AA-D AS REVISED, AND BELL SYSTEM DATA COM-MUNICATIONS TECHNICAL REFERENCE MANUAL, DATA SET 103A INTERFACE SPECIFICATION),
- 1.2.4.1 CIRCUIT BA, TRANSMITTED DATA, SHALL BE CONNECTED TO THE DC108 CIRCUIT LN PNTR EIA.
- 1.2.4.2 CIRCUIT BB, RECEIVED DATA, SHALL BE CONNECTED TO THE DC108 CIRCUIT LN KYBD EIA.
- 1.2.4.3 CIRCUITS AA AND AB, SIGNAL GROUND AND PROTECTIVE GROUND SHALL BE CONNECTED TO THE DC18E CIRCUIT LN AB (GND).
- 1,2.4.4 CIRCUIT CD, DATA TERMINAL READY SHALL BE CONNECTED TO THE DC18E CIRCUIT LN DATA DATA TRM RDY ETA.
- 1,2,4,5 CIRCUIT CB, CLEAR TO SEND, SHALL BE CONNECTED TO THE DC10E CIRCUIT LN CLR TO SND EIA.
- 1.2.4.6 CIRCUIT CE, RINGING INDICATOR SHALL BE CONNECTED TO THE DC10E CIRCUIT LN RSTRN DETCTD EIA.
- 1.2.4.7 THIS INFORMATION IS DESCRIBED IN FIGURE 2-8-G OF THE DC10 MANUAL.

- 1.2.5 THE DATASET AS SUPPLIED BY THE TELEPHONE COMPANY MUST HAVE THE FOLLOWING OPTIONS, FOR SATISFACTORY OPERATION:
 - 2.5.1 AUTOMATIC ANSWER MUST BE PRESENT.
 - 2.5.2 INITIATE DISCONNECT MUST BE PRESENT.
 - 2.5.3 RESPOND TO DISCONNECT MUST BE PRESENT.
 - 2.5.3 IF THE DATASET IS A 103E OR 103G, THEN "CB-CF INDICATION COMMON" MUST BE PRESENT.
- 1.2.6 THE "DTR OS" SWITCH ON THE CONTROL PANEL OF THE DC10 MUST BE IN THE ON (UP) POSITION AT ALL TIMES.
- 1.3 FUNCTIONS PROVIDED BY THE SOFTWARE:
- 1,3,1 INITIALIZATION:

WHEN THE MONITOR IS STARTED (OR RESTARTED), EACH DC10E LINE WILL BE INTERROGATED FOR THE PRESENCE OF A CARRIER. IF NO CARRIER IS PRESENT, THE DATASET WILL BE HUNG UP. IF A CARRIER AS PRESENT, THE DATASET WILL BE LEFT ENABLED. IN EITHER CASE, THE STATE OF THE CARRIER FLAG IS REMEMBERED IN CORE.

1.3.2 RESPONSE TO RINGING:

WHEN A LINE RINGS, LOCATION "STATES" WILL BE CHECKED FOR THE ABSENCE OF BIT 34, UNLESS INHIBITED BY BIT 34 OF STATES, DATA TERMINAL READY WILL BE SET FOR THIS LINE, CAUSING THE CALL TO BE ANSWERED BY THE DATASET, FIFTEEN-SECOND COUNT WILL BE STATED, SO THAT THE CALL MAY BE ABANDONED IF NO CARRIER IS RECEIVED AFTER THAT TIME, (THE RIGHT HALF OF LOCATION STATES MAY BE BET TO AN OCTAL NUMBER "N" BY THE MONITOR COMMAND "SCHEDULE N" TYPED AT THE OPERATOR'S CONSOLE.)

1.3.3 RESPONSE TO CARRIER-ON:

WHEN A CARRIER AS RECEIVED ON A LINE THE RECEIPT OF A "CONTROL"C" CHARACTER WILL BE SIMULATED. THERE WILL NOT BE AN AUTOMATIC LOGIN OPERATION IN THE INITIAL SYSTEM.

1.3.4 RESPONSE TO CARRIER-OFF:

WHEN A CARRIER-OFF SIGNAL IS RECEIVED, ANOTHER "CONTROL-C" WILL BE SIMULATED, THERE WILL NOT BE AN AUTOMATIC DETACH OR LOGOUT OPERATION IN THE INITIAL SYSTEM,

MONSUP.MAN PAGE 4

1.4 IMPLEMENTATION:

THE DATA STRUCTURES ASSOCIATED WITH THE DATA-SETS ARE DESCRIBED IN SUBROUTINES COMMON, DISINT AND MONGEN, THERE ARE NO CONDITIONAL ASSEMBLIES ASSOCIATED WITH THE DC10E CODE, BUT TABLE SPACE WILL BE SAVED IF NO DC10E IS PRESENT.

2.2 UU0'S

2,2,1 TEMPORARY FILE STORAGE FOR JOB UUO, TMPCOR (44)

THE "TMPCOR" UUO IS USED TO ENABLE A JOB TO LEAVE SEVERAL SHORT FILES IN CORE FROM THE RUNNING OF ONE USER PROGRAM OR CUSP TO THE NEXT. THESE FILES MAY BE REFERRED TO BY A THREE CHARACTER FILE NAME, AND ARE UNIQUE TO EACH JOB, I.E. A JOB CAN ONLY REFERENCE ITS OWN FILES, ALL FILES ARE ALWAYS DELETED WHEN A JOB IS KILLED.

EACH FILE APPEARS TO THE USER AS ONE DUMP MODE BUFFER. THE ACTUAL SIZE OF A TEMPORARY FILE, THE NUMBER OF TEMPORARY FILES A USER CAN HAVE, AND THE TOTAL CORE SPACE A USER CAN TIE UP ARE PARAMETERS DETERMINED AT MONGEN TIME, ALL TEMPARARY FILES RESIDE IN A FIXED AREA IN THE MONITOR, BUT THE SPACE IS DYNAMICALLY ALLOCATED AMOUNG DIFFERENT JOBS AND THE SEVERAL DIFFERENT FILES OF ANY GIVEN JOB.

THE PRIMARY PURPOSE OF THE TEMPORARY STORAGE SYSTEM IS FOR SHORT CONTROL FILES, E.G. CCL FILES, TO LIVE IN CORE, THEREBY SPEEDING UP RESPONSE TIMES AND REDUCING DISK OPERATIONS, ACCORDINGLY, SHOULD A PROGRAM ATTEMPT TO HRITE A FILE WHEN THERE IS INSUFFICIENT SPACE, EITHER IN THE ENTIRE BUFFER AREA OR BECAUSE THE USER HAS EXCEEDED HIS QUOTA, THE UOU GIVES AN ERROR RETURN. THE CUSP CAN THEN WRITE THE DATA AS A SHORT DISK FILE, SIMILARLY, SHOULD A PROGRAM FAIL TO FIND A FILE UPON READING IT, IT WILL GET AN ERROR RETURN AND CAN THEN LOOKUP A SHORT DISK FILE,

IT IS VERT IMPORTANT TO REALIZE THE TEMPORARY NATURE OF THESE FILES, FOR EXAMPLE, UPON HRITING, THE OLD FILE IS DELETED BEFORE CHECKING FOR SPACE FOR A NEW VERSION, THE OLD FILE COULD BE LOST WITHOUT A NEW ONE REPLACING IT, ALSO, THERE CAN BE NO GUARANTEE THAT FILES WILL FIT IN BORE,

THE THPCOR DUO IS NOT INTENDED TO REPLACE A PUTURE, MORE GENERAL, DEVICE INDEPENDENT SERVICE ROUTINE FOR "CORE", HOWEVER, THE SPACE TAKEN UP BY DEVICE DATA BLOCKS, ETC., IN THAT MORE GENERAL ROUTINE WOULD REPRESENT UNNECESSARY OVERHEAD FOR EXTREMELY SHORT DATA, SUCH AS CCL COMMAND FILES.

MONSUP, MAN PAGE 6

FORMAT OF TEMPORARY FILE STORAGE UUO.

CALL AC, [SIXBIT /TMPCOR/] | ICALLI INDEX=44 JERROR RETURN | JORNAL RETURN

C(AC) MUST ALWAYS BE SET UP BY THE USER PROGRAM PRIOR TO EXECUTING THE UUO, IT IS CHANGED BY THE UUO AND RETURNS A VALUE THAT DEPENDS ON THE PARTICULAR FUNCTION PERFORMED.

C(AC) = XWD CODE, BLOCK

BLOCK: XWD NAME,Ø JNAME IS FILE NAME 10WD BUFLEN,BUFFER JUSER BUFFER AREA (ZERO FOR NO BUFFER)

CODE-Ø -- GET FREE SPACE

THE IS THE ONLY FORM OF THE TEMP UUO THAT DOES NOT USE A THO WORD PARAMETER BLOCK, C(AC) WOULD ORDINARLY BE SET TO ZERO FOR THE GET FREE SPACE UUO, THE USER PROGRAM ALWAYS GETS A NORMAL RETURN (UNLESS THE SYSTEM DOES NOT HAVE THE TEMP UUO), C(AC) IS SET TO THE NUMBER OF WORDS OF FREE SPACE AVAILABLE TO THE USER.

CODE=1 -- READ FILE

IF THE SPECIFIED FILE NAME IS NOT FOUND, C(AC) IS SET TO THE NUMBER OF FREE WORDS OF SPACE AVIALABLE FOR TEMP FILES, AND THE ERROR RETURN IS TAKEN.

IF THE FILE IS FOUND, C(AC) IS SET TO THE LENGTH OF THE FILE IN WORDS, AND AS MUCH OF THE FILE AS WILL FIT IS COPIED INTO THE USERS BUFFER. THE USER CAN CHECK FOR TRUNCATION BY COMPARING C(AC) WITH BUFLEN UPON SUCCESSFUL RETURN FROM THE TEMP UUC.

CODE=2 -- READ AND DELETE FILE

THIS $\bar{I}S$ THE SAME AS CODE=1, EXCEPT THAT IF A FILE WAS FOUND IT IS ALSO DELETED AND ITS SPACE RECLAIMED.

CODE=3 -- WRITE FILE

IF THERE IS ALREADY A FILE OF THE SPECIFIED NAME, IT IS DELETED AND ITS SPACE IS RECLAIMED.

THE REQUESTED SIZE OF THE FILE IS SPECIFIED BY BUFLEN. IF THERE IS NOT ENOUGH SPACE TO WRITE THE ENTIRE FILE, NOTHING IS WRITTEN, C(AC) IS SET TO THE NUMBER OF FREE WORDS OF SPACE AVAILABLE TO THE USER, AND THE ERROR RETURN IS TAKEN.

IF THERE IS ENOUGH SPACE, THE FILE IS WRITTEN. C(AC) IS SET TO THE AMOUNT OF SPACE LEFT AFTER THE FILE HAS BEEN WRITTEN AND THE NORMAL RETURN IS TAKEN, FILES ARE ALWAYS FILLED UP WITH ZEROS TO THE NEXT EVEN MULTIPLE OF THE BLOCK LENGTH (TMPBL). THIS EVEN LENGTH IS READ BACK IN.

CODE=4 -- READ DIRECTORY

THE ERROR RETURN IS NEVER TAKEN.

C(AC) IS SET TO THE NUMBER OF DIFFERENT FILES IN THE JOB'S TEMPORARY FILE AREA, IN ADDITION, AN ENTRY IS MADE FOR EACH FILE IN THE USER BUFFER AREA UNTIL THERE IS NO MORE SPACE OR ALL FILES HAVE BEEN LISTED, THE USER PROGRAM CAN CHECK FOR TRUNCATION BY COMPARING C(AC) UPON RETURN WITH BUFLEN.

DIRECTORY ENTRY FORMAT XMD NAME, SIZE | SIZE

CODE=5 -- READ AND CLEAR DIRECTORY

THIS IS THE SAME AS CODE#4 EXCEPT THAT ANY FILES IN THE JOB'S TEMPORARY STORAGE AREA ARE ALSO DELETED AND THEIR SPACE RECLAIMED.

THIS DUD IS EXECUTED BY THE LOGOUT CUSP.

IMPLEMENTATION

MASTER DIRECTORY

THIS IS A TABLE JOBN+1 ENTRIES LONG.

JBTTMP: XWD FREE, IDLE JBTTM1: XWD SPACE, LINK

•

MREE = NO. OF FREE BLOCKS IN MONITOR BUFFER AREA
IDLE = LINK TO FIRST FREE BLOCK OR Ø IF NO FREE BLOCKS
SPACE = NO OF FREE BLOCKS REMAINING IN JOBS QUOTA
LINK = LINK TO FIRST BLOCK OF FIRST FILE OF JOB, Ø IF NONE.

IDLE BLOCK FORMAT

XWD Ø,LINK REPEAT TMPBL, <Ø

LINK = LINK TO NEXT BLOCK ON IDLE CHAIN, Ø IF NO MORE.

USER BLOCK FORMAT

XHD NAME,LINK BLOCK TMPBL ; USER DATA OR ZERO FILL.

NAME = USER FILE NAME, LINK = LINK TO NEXT BLOCK IN THIS FILE OR NEXT FILE OF THIS USER

IF A FILE IS SEVERAL BLOCKS LONG, EACH BLOCK HAS THE FILE NAME. A LINK OF \emptyset indicates no more data in the file, and no more files for this user.

THEREFORE, A FILE ENDS WHEN ITS LAST BLOCK HAS A ZERO LINK, OR WHEN IT LINKS TO A FILE OF DIFFERENT NAME.

MONITOR BUFFER AND PARAMETERS

TMPBUF: BLOCK TMPBKS*<TMPBL+1> :BUFFER AREA FOR ALL FILES.

TMPBKS IS THE NUMBER OF BLOCKS THE STORAGE AREA IS COMPUTED, IT IS COMPUTED BY MACRO DURING THE ASSEMBLY OF COMMON. TMPBL IS A PARAMETER IN S,MAC.

VØØ2

VØØ2

VØØ2

VØØ2

VØØ2

VØØ2

TRE ALLOWED ONLY WITHIN MODULES.

WE DEFINITELY REQUIRE A MORE DISCIPLINED USE OF ACCUMULATORS
WITHIN THE MONITOR NOT ONLY TO REDUCE EXTRANEOUS PUSH'S AND POP'S
BUT ALSO TO ENABLE ALL SUBROUTINES TO ASSUME INTEGRITY OF DATA
IN AC'S, THREE CLASSES OF ACCUMULATORS ARE DEFINED:

- 1. GLOBAL
- 2. TEMPORARY
- 3, PRESERVED

GLOBAL ACCUMULATORS SUCH AS THE CURRENT F,P,R ALWAYS CONTAIN THE SAME TYPE OF INFORMATION. ONLY A SELECT SET OF ROUTINES EVER EXPLICITLY MODIFIES THE CONTENTS OF GLOBAL AC'S. GLOBAL ACS ARE IMPLICIT ARGUMENTS TO MANY ROUTINES.

TEMPORARY ACCUMULATORS SUCH AS CURRENT 1,11, ETC., ARE USED FOR WORKING STORAGE AS WELL AS BEING THE STANDARD PLACE TO PASS ARGUMENTS AND RETURN VALUES.

PRESERVED ACCUMULATORS FORM A NEW AND MUCH NEEDED CLASS, PRESERVED AC'S MAY BE USED AS DESIRED AFTER BEING SAVED, THEIR INTEGRITY IS ASSURED AS ALL SYSTEM SUBROUTINES WILL USE A COMMON SET OF ROUTINES TO SAVE AND RESTORE THESE AC'S, THEY WILL NOT BE USED TO RETURN VALUES, HOWEVER THEY MAY BE USED TO PASS ARGUMENTS WHEN THE QUANTITIES ARE THE TYPE OF THING WHICH WANT TO STAY ARGUND ACCROSS A NUMBER OF SUBROUTINE CALLS.

SUBROUTINES SAV1, SAV2, SAV3 AND SAV4 WILL BE USED TO PRESERVE 1, 2, 3 OR 4 OF THE COMMON PRESERVED AC'S, PRESERVED AC'S MUST BE USED IN ORDER, THAT IS IF ONE IS REQUIRED P1 IS USED, IF THO ARE REQUIRED P1, P2 ARE USED AFTER CALLING SAV1, SAV2 RESPECTIVELY, THE STANDARD POPU P, OR JRST CPOPJ1 RETURNS WILL RESTORE ALL OF THE PRESERVED AC'S UPON EXIT RELIEVING EACH SUBROUTINE OF THAT TEDIOUS DUTY.

VØØ3 THE NAMES OF ALL SUBROUTINES SATISFYING THESE CONVENTIONS WILL VØØ3 TONTAIN SIX CHARACTERS, WHILE VIOLATORS OF CONVENTION (SEE 2.2) VØØ3 WILL BE GIVEN 5 OR FEHER CHAR NAMES, THIS MAKES IT CLEAR TO THE READER WHEN HE SEES A PUSHJ WHAT IS WHAT WITHOUT GOING TO VØØ3 THE BUBROUTINE.

EXAMPLE OF AC SAVING ROUTINE AND USE SUBR! JSP T3,5AV2

JRST CPOPJ1

PUSH P,P1 PUSH P,P2 PUSHJ P,(T3) JRST .+2 AOS ~ 2(P) POP P,P2 POP P,P1 POPJ P, SAV21

VØØ2

NO SUBROUTINE WILL "POP UP MORE THAN ONE LEVEL" ON A RETURN,
TPOPU AND TPOPUI MAY BE USED ONLY FOR POPPING OFF DATA (RATHER
THAN A RETURN). THUS THE PROGRAM FLOM IS ALWAYS APPARANT
TO THE READER BECAUSE IT ALWAYS RETURNS IMMEDIATELY AFTER
VØØ6

PUSHJ OR ONE LOCATION AFTER IT IF SUBROUTINE CAN GIVE A SKIP RETURN.
NO SUBROUTINE WILL PASS ARGUMENTS OR RETURN VALUES
ON THE PUSH DOWN LIST, NO SUBROUTINE WILL
LEAVE THE PUSHOWN LIST IN A DIFFERENT CONDITION
OR DIFFERENT DEPTH THAN WHEN IT WAS CALLED,
(EXCEPT OF COURSE SUCH ROUTINES AS SAVI...SAV4,
CPOPU, CPOPU1, TPOPU, AND TPOPU1 WHICH EXIST
SOLELY FOR THE PURPOSES OF HANDLING THE PUSH DOWN LIST,

VØØ2

VØØ3

VØØ3

VØØ3

VØØ3

TOLLOWING THO EXCEPTIONS ARE ALLOWED:

(THESE SUBROUTINES ARE FLAGGED BY GIVING THEM FIVE OR FEWER

STMBOLS IN THEIR NAMES.)

- A, A SUBROUTINE (AND ALL THE ONES IT CALLS) MAY BE DESIGNED TO RESPECT THE CONTENTS OF SPECIFIED TEMPORARY ACS, RESPECT MEANS THAT A SUBROUTINE (AND ALL THE ONES IT CALLS) EITHER DO NOT CHANGE THE CONTENTS OF AN AC (IT MAY OR MAY NOT BE AN ARGUMENT) OR IT PUSH'S IT BEFORE MODIFICATION AND POP'S IT BEFORE RETURN, WHEN THIS IS THE CASE THE COMMENTS AT THE BEGINNING OF THE SUBROUTINE WILL SAY:

 "ITHIS SUB, AND ALL THE ONES IT CALLS RESPECT THE CONTENTS OF TEMP ACS T1, T3, " " FOR EXAMPLE
- V883

 I. A SUBROUTINE MAY RETURN A VALUE IN A PRESERVED AC (SO THAT V883 THE AC IS NOT PRESERVED), THIS EXCEPTION WILL ALSO BE CLEARLY STATED AT THE BEGINNING OF A SUBROUTINE, THIS TECHNIQUE WILL BE USED INFREQUENTLY AND WILL BE USED FOR SETTING UP A PRESERVED AC FOR A RELATIVELY GLOBAL QUANTITY WITHIN A MODULE.
- VØØ3 ĀLĹ ĴRST'S WILL BE TO TAGS DOWN PAGE, EXCEPT LOOPS. THUS FLOW VØØ3 GOES DOWN THE PAGE, AND THE READER MAY START AT THE BEGINNING OF THE CODE AND READ THE PROGRAM WITHOUT BECOMING CONFUSED ABOUT THE PROGRAM FLOW.

3. SEQUENCING OF OPERATIONS

THE OPERATIONS OF THE FILE SYSTEM WILL BE CAREFULLY DESIGNED SO THAT A SYSTEM CRASH AT ANY TIME WILL NOT LEAVE THE DISK IN A STATE WHICH WILL CAUSE MORE INFORMATION TO BE LOST. THUS THE ORDER OF WRITING DISK BLOCKS OF FILES WHICH DESCRIBE THE FILE STRUCTURE IS IMPORTANT (MFD, UFD, SAT, RIB). ALSO IMPORTANT IS THE ORDER IN WHICH CORE MEMORY LOCATIONS ARE UPDATED AND CHANGED. AN ATTEMPT WILL BE MADE TO ALLOW A JOB TO BE STOPPED (CONTROL C) OR RESCHEDULED AT ANY TIME DURING DISK IO OR BETWEEN ANY THO INSTRUCTIONS. THE NO SCHEDULE, SCHEDULE MACRO WILL BE USED AROUND GROUPS OF INSTRUCTIONS FOR WHICH NO SCHEDULING (AND. THEREFORE STOPPING OF THIS JOB) CAN OCCUR. SOME DATA LOCATIONS ARE CHANGED AT UUD AND INTERRUPT LOCATIONS. THE NUMBER OF SUCH LOCATIONS SHALL BE MINIMIZED AND SHALL BE CLEARLY LABELLED.

THE DISK SERVICE WILL BE PROGRAMMED SO THAT IT WILL BE ABLE TO RECOVER FROM ANY CONDITION IN WHICH THE USER TYPED CONTROL C AND STARTED HIS PROGRAM OVER AGAIN. TO ASSIST IN THIS, EACH ACCESS TABLE ENTRY (ONE PER ACTIVE OR DORMANT FILE) AND EACH DDB (ONE PER ACTIVE FILE-USER PAIR) WILL HAVE A SIMPLE STATE CODE IN IT, RATHER THAN BITS, SO THAT A SIMPLE DISPATCH ON PREVIOUS STATE CODE WHEN AN EVENT OCCURS WILL MAKE SURE THAT ALL POSSIBILITIES ARE ACCOUNTED FOR. IF ANY SEQUENCE OF INSTRUCTIONS (NO IO WAIT) MUST BE EXECUTED HITHOUT INTERRUPT THEN THE NOSHEDULE, SCHEDULE MACRO WILL BE USED.

SEQUENCING OF DISK BLOCK WRITES

THIS PROBLEM BECOMES MORE DIFFICULT BECAUSE THE OPTIMIZATION CODE WILL NOT NECESSARILY WRITE BLOCKS IN THE ORDER IN WHICH THEY ARE QUEUED. THE PROBLEM BECOMES EVEN MORE COMPLEX WHEN DIFFERENT SPEED DEVICES ARE PART OF THE SAME FILE STRUCTURE (E.G., DRUM AND BRYANT DISK), HOWEVER A REQUEST TO WRITE A GIVEN BLOCK FOLLOWED BY A REQUEST TO READ THE SAME BLOCK WILL ALWAYS OCCUR IN FIRST COME FIRST SERVE ORDER,

ORDER OF READING, WRITING, AND READ PAUSE WRITE OF BLOCKS

- COMEAN POSSIBLE REPEATED READS OR WRITES. EXIT FROM LOOP NOT NECES-
- SARILY AT BOTTOM.

 13 MEAN MAY BE UNNECESSARY BECAUSE OF RETRIEVED INFORMATION IN CORE.

 THE REASON IS INDICATED IN A SECOND SET OF BRACKETS.

FNDFIL SETS STATE OF ACCESS BLOCK ON INCREASES READ COUNT, ETC SO F. FNDFIL INITIALIZES ALL LOCATIONS IN ANY CORE BLOCKS IT CREATES, G. FNDFIL RETURNS ERROR CODES ON ALL ERROR RETURNS; THESE ARE PASSED BACK TO USER

BÂCK TO USER H. FNDFIL LEAVES RIB IN MONITOR BUFFER ONLY IF IT HAD TO READ IT [IOSMBF SET]

FLOW FOR FNDFIL CALLED BY LOOKUP, SEARCH, ENTER, RENAME

AN ACCESS BLOCK CAN BE IN EXACTLY ONE OF THE FOLLOWING STATES WHEN ENCOUNTERED BY FNDFIL: STATES WHEN ENCOUNTERED BY FNDFIL!
BECAUSE OF THE RESTRICTIONS ON ENTER, MOST OF THE TIME THERE CAN BE
AT MOST ONE ACCESS BLOCK HITH A GIVEN FILE NAME
(AND FILE STRUCTURE, PROJ.PROG AND EXTENSION), THE EXCEPTIONS
ARE THAT R AND S MAY OCCUR SIMULTANEOUSLY IN THO
DIFFERENT ACCESS BLOCKS, ALSO AN ARBITRARY NUMBER OF EXTRA
ENTRIES MAY BE MARKED FOR DELETION (K)
BECAUSE THEY HAVE BEEN SUPERCEDED, BUT SOME SLOW READERS ARE STILL
READING OLDER VERSIONS, THESE ACCESS BLOCKS HOWEVER ARE NOT SEEN BY FNDFIL
SINCE THEY ARE REMOYED FROM THE RING OF ACCESS BLOCKS FOR THE NAME BLOCK
WHEN THEY ARE MARKED FOR DELETION, FINALLY IF THE PROJECT-PROGRAMMER
NUMBER HAS MORE THAN ONE FILE BY THE SAME NAME IN DIFFERENT
FILE STRUCTURES, THERE WILL BE A SEPARATE ACCESS BLOCK FOR EACH FILE STRUCTURES, THERE WILL BE A SEPARATE ACCESS BLOCK FOR EACH

IN ORDER TO SAVE DISK SEEKS, FNDFIL REMEMBERS RECENT FILE NAMES ALONG WITH THE PROJECT PROGRAMMER NUMBERS AND FILE STRUCTURES IN WHICH THEY WERE FOUND.

THIS ASSOCIATIVE CORE INFORMATION HAS A RATHER COMPLEX STRUCTURE IN ORDER TO SPEED UP SEARCHES THROUGH IT. THE LISTS ARE AS FOLLOWS:

THE SYSTEM HAS A LIST OF RECENTLY ACCESSED PROJECT-PROGRAMMER NUMBERS (SYSPPB-PPBSYS).
EACH PROJECT PROGRAMMER NUMBER BLOCK (PPB) HAS THO LISTS!

- EACH PROJECT PROGRAMMER NUMBER BLOCK [PPB] HAS THO LISTS:

  A. A UFD BLOCK LUFB] FOR EVERY FILE STRUCTURE IN WHICH THE PROJECT—
  PROGRAMMER NUMBER HAS A UFD LPPBUFB-UFBPPB]

  B. AND A NAME BLOCK LIME] FOR EVERY NAME WITH THIS
  PROJECT PROGRAMMER NUMBER (INDEPENDENT OF FILE STRUCTURE)[PPBNME=NMEPPB]

  EACH NAME BLOCK HAS AN ACCESS BLOCKLACC], LIST WITH AN ENTRY
  FOR EVERY ACTIVE FILE WITH THAT PROJECT PROGRAMMER NUMBER
  AND NAME, INMBACC-ACCINB]

IN ORDER TO ELIMINATE FRUITLESS SEARCHES, THE PROJECT PROGRAMMER NUMBER BLOCK HAS A BIT FOR EACH OF THE UP TO 14 ON-LINE FILE STRUCTURES WHICH SAY WHETHER UFD EXISTS FOR THE PROJECT-PROGRAMMER NUMBER OR NOT OR WHETHER WE DON'T KNOW YET, SIMILARLY THE NAME BLOCK ENMB! HAS A BIT FOR EACH OF UP TO 14 ON-LINE FILE STRUCTURES WHICH SAY WHETHER FILE EXISTS FOR THE PROJECT PROGRAMMER NUMBER OR NOT OR WHETHER WE DON'T KNOW YET.

FLOW FOR FILE STRUCTURE UUO - STRUUO

CALL:

MOVE

AC,[XWD N,LOC] AC,[SIXBIT .STRUUO,] OR CALLI AC,5Ø CALL

N IS THE NUMBER OF WORDS IN THE ARGUMENT LIST STARTING AT LOCATION LOC. FOR FIXED LENGTH ARGUMENT LISTS, N MAY BE \emptyset ,

THE FIRST WORD SPECIFIES THE FUNCTION REQUESTED.

FUNCTION=

Ø FOR SETSRC 1 FOR DEFFST 2 FOR LOKFST 3 FOR REMFST

SETSRC DEFINES THE FILE STRUCTURE SEARCH LIST FOR THE JOB

THE USER MAY DETERMINE HIS CURRENT FILE STRUCTURE SEARCH NOTE: LIST BY USING THE JOBSTR UUO. HE MAY UNLINK HIMSELF FROM A FILE STRUCTURE BY LEAVING IT OFF THE NEW FILE STRUCTURE SEARCH LIST. THE USER MAY SPECIFY HIS PROJECT LIBRARY OR SYS TO BE INCLUDED IN HIS FILE STRUCTURE SEARCH LIST. PROJECT LIBRARY MUST BE FILE STRUCTURE NAME DSK FOR LEVEL D. AND MUST BE HIS PROJECT NUMBER AND PROGRAMMER NUMBER Ø. MAXIMUM NUMBER OF FILE STRUCTURES, NOT INCLUDING PROJECT LIBRARY OR SYS, IS 9.

ARGUMENTS: THREE WORD BLOCKS:

FIRST WORD = SIXBIT FILE STRUCTURE NAME LEFT JUSTIFIED
SECOND WORD = PROJECT, PROGRAMMER NUMBER
THIRD WORD: BIT Ø=1 IF SOFTWARE WRITE PROTECTION REQUESTED
BIT 1=1 IF NO CREATE ON THIS FILE STRUCTURE REQUESTED

(UNLESS THE SPECIFIC FILE STRUCTURE IS OPENED)

ERROR RETURNS: 1 OR MORE FILE STRUCTURES DON'T EXIST 1 OR MORE FILE STRUCTURES SINGLE ACCESS ONLY TOO MANY ENTRIES

TASKS: IF ARGUMENT LIST OUT OF BOUNDS, TO ERR

VERIFY THAT ALL FILE STRUCTURES IN THE USER'S SEARCH LIST EXIST

IF ANY FILE STRUCTURE IS SINGLE ACCESS AND MOUNT COUNT NO Ø, TO ERR

FOR EACH FILE STRUCTURE ON THE NEW SEARCH LIST

IF THE FILE STRUCTURE IS NOT ON THE USER'S OLD FILE STRUCTURE SEARCH LIST, INCREMENT THE MOUNT COUNT

FOR EACH FILE STRUCTURE NO LONGER ON THE SEARCH LIST, DECREMENT THE MOUNT COUNT

MAKE THE NEW LIST THE SEARCH LIST

EXIT

DEFSTR DEFINES A FILE STRUCTURE FOR THE SYSTEM

ARGUMENTS:

5. GLOSSARY

DATA STRUCTURE

SKELETON FILE STRUCTURE

2 HOME BLOCKS
HOME BLOCK OR VITAL STATISTICS BLOCK CONTAINS A PACK ID
AND OTHER BASIC INFORMATION, HOME BLOCKS ARE ALWAYS
WRITTEN IN KNOWN FIXED LOCATIONS.

THE MASTER FILE DIRECTORY, A FILE NAMED 11, UFD OF THE SAME FORM AS ALL OTHERS CONSISTING OF RETRIEVAL INFORMATION AND DATA.

SAT

STORAGE ALLOCATION FILE. THE FILE *SAT*, SYS
CONSISTING OF RETRIEVAL INFORMATION AND DATA
BESCRIBING THE INITIAL ALLOCATION OF SPACE.

SWAPPING FILE
THE OPTIONAL FILE *SWAP*, SYS CONSISTING OF ALLOCATTED SPACE
ONLY, CONSIDERING THE SPACE AS A FILE ALLOWS A FILE
VERIFICATION PROGRAM TO MAKE THE CORRECT INTERPRETATION
THAT SWAPPING SPACE IS BOTH ASSIGNED AND USED IN SOME FILE.

MAINTENANCE AREA
THE OPTIONAL FILE *MAINT*, SYS CONSISTS ONLY OF ALLOCATED SPACE
ON THE BRYANT DISK AND DISK PACKS DENOTING THESE
BLOCKS RESERVED FOR MAINTENANCE OR DIAGNOSTIC USE,

SPARSE FILE
A FILE WHOSE DATA IS CONTAINED ONLY IN THE SECOND BLOCK OF
EVERY GROUP (HOME.SYS AND SAT.SYS). ALL OTHER FILES ARE DENSE
SO THAT THE SECOND BLOCK THROUGH THE LAST BLOCK (EXCEPT LAST
GROUP OF FILE) CONTAIN DATA.

COMPRESSED UPD POINTER (CUP)
SUPER CLUSTER NUMBER AND UNIT NUMBER FOUND ONLY IN UFD'S,
COMPRESSED TO FIT INTO 18 BITS,

ROOT RIB

THE FIRST RIB OF A FILE

THE RETRIEVAL POINTERS POINT TO "GROUP RIB" AND MAY ALSO POINT
TO A NEXT "CONTINUATION RIB" OF A PREVIOUS "CONTINUATION FILE"

GROUP RIS THE RIB IN FRONT OF EVERY GROUP EXCEPT IF A ROOT OR CONTINUOUS RIBS

CONTÍNUATION RÍB OCCURS ONLY FOR LONG FILES WHEN ROOT RIB RUNS OUT OF ROOM TO MOLD RETRIEVAL POINTERS

2. OVERVIEW

FILTST IS A MACRO SOURCE PROGRAM WHICH DEFINES A MACRO LEVEL LANGUAGE INTENDED AS A CONVENIENT MEDIUM IN WHICH TO WRITE PROCEDURES WHICH EXERCISE AND TEST THE FILE HANDLING CAPABILITIES OF THE POP-10 TIME-SHARING MONITOR. IN ORDER THAT THIS MACRO LANGUAGE POSSESS THE GENERALITY AND FLEXIBILITY OF THE STANDARD USER MODE TECHNIQUES FOR DOING FILE I/O AT ASSEMBLY LEVEL, THE LANGUAGE IS NECESSARILY QUITE CLOSE TO STANDARD USER-MODE I/O, AND IS INTENDED TO BE USED BY SOMEONE THOROUGHLY FAMILIAR WITH THE STRUCTURE AND CALLING SEQUENCES OF THE STANDARD UUOS, HOHEVER, IT IS INTENDED TO RELIEVE THE PROGRAMMER OF ATTENTION TO BIT AND WORD LEVEL DETAIL AND TO PERMIT HIM TO SPECIFY REASONABLY COMPLEX DISK OPERATIONS WITH SIMPLICITY AND COMPACTNESS AT BOTH SOURCE AND OBJECT LEVELS.

FILTST IS NOT A "CONDITIONAL LANGUAGE, THAT IS, IT IS NOT INTENDED THAT FILE OPERATIONS BE "TRIED TO SEE WHAT HAPPENS", WITH SUBSEQUENT ACTION DEPENDING UPON A PREVIOUS RESULT. RATHER, IT IS INTENDED THAT THE USER WHO PREPARES ANY TEST PROCEDURE HAVE AN UNDERSTANDING OF EXACTLY WHAT SHOULD HAPPEN WHEN THE PROCEDURE IS EXECUTED, FILTST WILL ATTEMPT TO PROVIDE DIAGNOSTIC INFORMATION WHENEVER A RESULT IS CONTRARY TO AN INDICATED EXPECTATION.

THE USE OF FILTST TYPICALLY INVOLVES THE PREPARATION OF AN AUXILIARY TEXT FILE IN THE FILTST LANGUAGE CONSISTING OF A NUMBER OF INDEPENDENT DEFINITIONS OF TEST PROCEDURES (WHICH MAY CALL EACH OTHER RECURSIVELY TO ANY DEPTH) AND A LIST OF WHICH OF THESE PROCEDURES ARE TO BE EXECUTED AND IN WHAT ORDER, THIS AUXILIARY FILE IS THEN ASSEMBLED WITH FILTST AND THE RESULTING SINGLY BINARY FILE IS LOADED AND EXECUTED. THE RUNNING TO COMPLETION OF THIS EXECUTION WITH NO UNUSUAL OUTPUT, INDICATES THAT ALL OF THE TESTS SPECIFIED IN THE AUXILIARY FILE RAN WITH SPECIFIED EXPECTATIONS BEING MET, ANY ERROR CONDITION, UNEXPECTED RETURN FROM A UUQ, OR UNEXPECTED VALUE RETURNED BY THE MONITOR WILL RESULT IN AN ERROR MESSAGE AT THE CONSOLE, THE USER IS THEN FREE TO PROCEDE FROM THE ERROR CONDITION, IGNORING IT, OR ATTEMPT TO ANALYZE THE PROBLEM BEFORE CONTINUING.

(2. CONT'D)

WHEN SOME ERROR DOES OCCUR, USUALLY BECAUSE SOME EXPECTATION
HAS NOT BEEN MET, THE USER IS FACED WITH THE PROBLEM OF
DETERMINING WHAT WENT WRONG, UNLESS THE TEST HAS RUN SUCCESSFULLY WITH THE SAME MONITOR BEFORE, THE FIRST GUESTION IS
LIKELY TO BE; "HAVE I DISCOVERED A BUG IN THE DISK SERVICE,
OR IS THERE A BUG IN BY TEST PROCEDURE?" UNFORTUNATELY, FILTST
IS HARD PRESSED TO DETERMINE THE DIFFERENCE AND THE USER MUST
RELY UPON ANALYSIS OF HIS PROCEDURES IN THE LIGHT OF WHAT
HAPPENED. IT IS FILTST'S MAIN ORDER OF BUSINESS TO SHOW THE USER
WHAT DID HAPPEN, THE ERROR TRACE PRINTED BY FILTST FOLLOWING
ANY ERROR MESSAGE WILL DISCLOSE THE EXACT PATH TAKEN THROUGH
THE USERS NESTED PROCEDURES AND AT JUST WHICH STEP OF WHICH
PROCEDURE THE ERROR OCCURRED, IT ALSO SHOWS THE NUMBER OF
TIMES EACH PROCEDURE HAS BEEN CALLED SUCCESSFULLY (MORE
DETAIL BELOW), IT IS HOPED THAT THIS INFORMATION AND A
SOURCE LISTING OF THE AUXILIARY FILE OF PROCEDURE DEFINITIONS
WILL BE SUFFICIENT IN MANY CASES FOR COMPLETE ANALYSIS OF THE
PROBLEM, FOR THOSE CASES IN WHICH IT IS NOT SUFFICIENT,
A COPY OF DDT IS LOADED WITH FILTST, ENOUGH OF FILTST'S
INTERNAL STRUCTURE, USE OF ACS ETC, IS PRESENTED BELOW SO
THAT DDT CAN BE USED EFFECTIVELY TO DISCOVER MORE ABOUT THE
CAUSE OF ANY ERROR MESSAGE,

MORE GENERALLY, THE OPERATION OF "PREPARING THE AUXILIARY FILE OF TEST PROCEDURES" IS LIKELY TO BE THE EXPANDING OF ONE OR MORE GROWING PROCEDURE FILES, IT IS INTENDED THAT VARIOUS OPERATING VERSIONS OF FILTST, EACH CONTAINING ITS OHN SUB SET OF PROCEDURES, BE SAVED IN CORE IMAGE FORM AFTER BEING DEBUGGED, TO BE USED REPEATEDLY TO TEST THE CONTINUED INTEGRITY OF THE MONITOR'S DISK SERVICE WHENEVER CHANGES ARE MADE TO IT,

3. WRITING TEST PROCEDURES

TEST PROCEDURES IN THE FILTST LANGUAGE ARE USUALLY SHORT AND QUITE COMPACT. THEY CONSIST MAINLY OF MACRO CALLS, SOME OF WHICH TAKE ONE OR MORE SIMPLE ARGUMENTS, UPON RARE OCCASIONS IT IS ALSO CONVENIENT TO INCLUDE A FEW BASIC PDP-10 INSTRUCTIONS WHICH REFERENCE A SMALL SET OF ACCUMULATORS KNOWN TO BE AVAILABLE AND A FEW ADDRESSES WITH PREDICTABLE MNEMONICS,

TO THE EXTENT THAT PROCEDURES ARE COMPACT, THEY ARE VERY EASY TO WRITE; UNFORTUNATELY, THEY ARE CORRESPONDINGLY DIFFICULT TO UNDERSTAND WITH RESPECT TO OVERALL INTENT UNLESS GENEROUSLY COMMENTED. A RECOMMENDED CONVENTION WHICH RESULTS IN A CLEAN CREF LISTING FOR LATER USE DURING ERROR ANALYSIS, IS THAT COMMENTS APPEAR IN BLOCKS PRECEDING PROCEDURE DEFINITIONS RATHER THAN ON INDIVIDUAL SOURCE LINES WITHIN THE PROCEDURES. COMMENTS ON LINES WITH MACRO CALLS ARE DELETED DURING ASSEMBLY, THIS IS TRUE BECAUSE IT IS FELT THAT A SOURCE-LIKE LISTING CONTAINING ONLY MACRO CALLS AND ARGUMENTS IS A MUCH MORE CONVENIENT TOOL FOR DEBUGGING THAN A LISTING IN WHICH MACRO EXPANSIONS ARE SHOWN. IN FACT SOME AMOUNT OF TROUBLE IS TAKEN TO AVOID ALL UNNECESSARY OUTPUT IN CREF LISTINGS.)

3.1 FILTST DATA BASE

SOME MONITOR UUO'S (EG, OPEN, LOOKUP, SEARCH, ENTER, RENAME) TAKE ARGUMENTS AND RETURN VALUES IN DATA BLOCKS WITHIN A JOBS LOW SEGMENT, A LARGE PART OF THE INTRICACY OF DOING DISK I/O IN USER MODE INVOLVES ESTABLISHING, SETTING, TESTING AND CLEARING THE RIGHT PARTS OF THESE UUO DATA BLOCKS, MANY OF THE FILTST MACROS EXIST FOR THE PURPOSE OF MAKING THIS JOB EASY. AS A COMPROMISE BETHEEN SIMPLICITY AND SIZE, THE FOLLOWING IMPLEMENTATION DECISIONS WERE REACHED;

- Î. THERE HILL BE A MAXIMUM NUMBER OF SOFTWARE CHANNELS WHICH ANY SINGLE JOB RUNNING FILTST CAN USE SIMULTANEOUSLY; THIS PARAMETER HAS BEEN ARBITRARILY SET AT FIVE (5) INITIALLY.
- 2. ALLOCATION OF CORE TO UUO DATA BLOCKS WILL NOT BE DYNAMIC; RATHER, SUFFICIENT DATA SPACE FOR THE MAXIMUM NUMBER OF SIMULTANEOUS CHANNELS WILL BE GENERATED AT ASSEMBLY TIME.

FOR EACH POTENTIALLY ACTIVE CHANNEL, THERE EXISTS IN FILTST'S LOW SEGMENT A BLOCK OF LOCATION CONSISTING OF THREE WORDS FOR USE WITH THE OPEN UUO, A SINGLE EXPANDABLE BLOCK (CURRENTLY SET AT TEN WORDS) FOR USE WITH ALL EXTENDED LOOKUP - SEARCH - ENTER - RENAME, UUOS, AND THREE OR MORE ADDITIONAL PARAMETER WORDS (TO BE EXPLAINED BELOW), THE GENERATION OF MEMONICS AND MACROS FOR EACH OF THE WORDS IN THIS "PER-CHANNEL" DATA BASE IS CONTROLLED BY THE DEFINITION OF THE ARGS MACRO TO BE FOUND ON PAGE 4 OF A LISTING OF FILTST, IT IS INTENDED THAT ONLY THE DEFINITION OF THIS ARGS MACRO NED IN ORDER TO REARRANGE OR EXPAND THE ARRAYS OF ARGUMENTS AND VALUES WHICH ACCOMPANY THE UUOS, IN FACT, THE ONLY SOURCE LEVEL DIFFERENCE BETHEEN THE VERSION OF FILTST FOR LEVEL C DISK SERVICE AND THAT FOR LEVEL D DISK SERVICE, IS A REAR-RANGEMENT OF FIVE ENTRIES (ENTRIES FOUR THROUGH EIGHT) IN THE ARGS MACRO.

3.2 THE SETXXX AND SELXXX MACROS

FOR EACH WORD IN THE "PER-CHANNEL" DATA BASE, THERE IS A MACRO OF THE FORM SETXXX WHERE THE LAST THREE CHARACTERS MATCH SOME THREE CHARACTER MNEMONIC WITHIN THE DEFIITION OF ARGS, BY MEANS OF EACH OF THESE MACROS, THE CORRESPONDING LOCATION IN THE DATA BASE CAN BE "SET". IN ADDITION TO ONE DATA BLOCK FOR EACH CHANNEL, THERE IS ONE "JOB STANDARD" DATA BLOCK HHICH IS INTENDED TO CONTAIN DEFAULT ARGUMENTS TO BE USED ON ANY USER CHANNEL WHENEVER A REQUIRED ARGUMENT HAS NOT BEEN PREVIOUSLY SET, THE VARIOUS ENTRIES IN THIS "JOB STANDARD" DATA BLOCK ARE SET BY MEANS OF SELXXX MACROS, FOR EVERY SETXXX MACRO, THERE IS A CORRESPONDING SELXXX "SELECT" MACRO, SELXXX MACROS ARE CHANNEL INDEPENDENT, WHILE SETXXX MACROS ARE CHANNEL INDEPENDENT, WHILE SETXXX MACROS BELOW).

3.2.1 MACRO ARGUMENTS

WITH CERTAIN SPECIAL EXCEPTIONS, MACRO ARGUMENTS ARE TYPICALLY EITHER DECIMAL NUMBERS (IMMEDIATE MODE) OR CHARACTERS WHICH SPECIFY AN ADDRESS WHOSE CONTENTS COMPRISES THE ARGUMENT, IN THE CASE OF SETXXX AND SELXXX MACROS, OBSERVATION OF THE ARGS DEFINITION AND THE COMMENTS WHICH PRECEDE IT WILL REVEAL WHICH OF THE MACROS ARE IMMEDIATE AND WHICH TAKE ADDRESS, OR SPECIAL ARGUMENTS, AS A COMPROMISE BETWEEN GENERALITY AND SIMPLE USEFULNESS, THOSE DATA BASE ENTRIES WHICH REQUIRE ADDRESS ARGUMENTS (I.E., THOSE OF MORE THAN IS BITS) ARE RESTRICTED TO A SET OF CHOICES GIVEN IN TABLES ON PAGE 8 OF FILTST. BY CONVENTION, A CHOICE IS MADE BY GIVING AS AN ARGUMENT TO A SETXXX OR SELXXX MACRO, JUST THE CHARACTERS FOLLOWING THE PERIOD IN LOCATION NAMES SHOWN IN THESE TABLES. THE TABLES CAN CERTAINLY BE EXPANDED, MODIFIED WITH DDT, OR PERHAPS (AS A POTENTIAL FUTURE FEATURE) SET CONVERSATIONALLY IN AN INITIALIZATION DIALOGUE.

3.3 THE SELCHN MACRO AND EXAMPLES

WITH THE EXCEPTION OF THE SELXXX MACROS WHICH MODIFY THE SINGLE CHANNEL INDEPENDENT DATA BASE, AND THE EXPECT MACRO (TO BE DESCRIBED BELOW) ALL MACROS PERTAIN TO SOME SOFTHARE CHANNEL. WHICH CHANNEL A MACRO PERTAINS TO IS NOT SPECIFIED IN THE MACRO CALL, BUT RATHER IS DETERMINED BY THE MOST RECENTLY EXECUTED SELCHN ("SELECT CHANNEL") MACRO, THIS IS SOFTHARE CHANNEL NUMBER AND THEN INDEPENDENT OF A SOFTWARE CHANNEL NUMBER AND THEN CALLED AFTER AN APPROPRIATE SELCHN MACRO, SELCHN IS A SPECIAL MACRO WHICH "SELECTS" THE CHANNEL TO WHICH ALL SUBSEQUENT MACROS (AND THE UUDS THEY STIMULATE) WILL APPLY UNTIL THE EXECUTION OF ANOTHER SELCHN MACRO. SOME EXAMPLES MAY CLARIFY THE ABOVE DISCUSSION.

MACRO SEQUENCE

SELNAM A

SELECT FILENAME FILTSA AS THE CHANNEL INDEPENDENT DEFAULT FILENAME IN THE "JOB STANDARD" DATA BASE (6TH WORD)

SELCHN2

SET STRUCTURE NAME TO DPAG IN DATA
BASE FOR CHANNEL 2 (2ND HORD)

SET THE DIRECTORY NAME TO ZERO (TO USE CURRENT PJ, PG) STILL IN DATA
BASE FOR CHANNEL 2.

(2ND WORD IN LOOKUP ETC, BLOCK = OR 5TH WORD IN CHANNEL DATA BASE)

SELCHN Ø SET THE NUMBER OF ARGUMENTS PASSED

SETARG 4 IN SUBSEQUENT LOOKUP ETC, UUOS TO 4
IN CHANNEL Ø DATA BASE (4TH WORD)

IT CAN BE SEEN THAT BY MEANS OF SETXXX MACROS FOLLOWING SOME SELCHN MACRO, ANY ENTRY IN THE UUD DATA ARRAYS CAN BE SET FOR ANY CHANNEL. NOT ALL OF THE ENTRIES DEFINED IN THE ARGS MACRO HAVE BEEN EXPLAINED SUFFICIENTLY AT THIS POINT; A COMPLETE DESCRIPTION OF EACH APPEARS IN THE LIST OF MACROS IN APPENDIX I, ALSO, THE PURPOSE OF THE CHANNEL INDEPENDENT SELXXX MACROS HAS NOT YET BEEN SUFFICIENTLY EXPLAINED, READ ON.

3.4 OTHER DATA BASE MACROS

IN ADDITION TO THE SETXXX MACROS FOR SETTING ENTRIES IN THE "PER CHANNEL" DATA BASE, AND SELXXX MACROS FOR "SELECTING" ENTRIES IN THE "JOB STANDARD" DATA BASE, FIVE OTHER MACROS ARE USEFUL IN SETTING DATA BASE ENTRIES:

CLRVAL WILL CLEAR THE ENTIRE DATA BASE FOR A PARTICULAR CHANNEL (DEPENDING AS USUAL UPON THE MOST RECENT SELCHN MACRO). IF AN ARGUMENT IS SUPPLIED TO CLRVAL, IT IS A DECIMAL NUMBER SPECIFYING WHERE THE CLEARING OPERATION IS TO BEGIN. FOR EXAMPLE, CLRVAL 7 WILL CLEAR ALL OF THE EXTENDED ARGUMENTS IN THE CURRENT CHANNEL LKP-ENT-REN BLOCK. (I.E., IT WILL NOT CLEAR THE FIRST 7 WORDS - THREE IN THE OPEN BLOCK AND FOUR IN THE LKP-ENT-REN BLOCK. ANY SINGLE DATA BASE HORD CAN BE CLEARED BY GIVING Ø AS AN ARGUMENT TO THE APPROPRIATE SETXXX MACRO, NO MATTER WHAT TYPE OF ARGUMENT THE PARTICULAR MACRO USUALLY TAKES.

RSTEXT AND RSTPRT WILL CLEAR ALL BUT THE EXTENSION AND PROTECTION FIELDS RESPECTIVELY IN THE CORRESPONDING WORDS IN THE CURRENT CHANNEL DATA BASE, THAT IS, THEY WILL CLEAR ANY VALUES THE MONITOR MAY HAVE RETURNED IN OTHER FIELDS IN THESE WORDS.

THE FORSET MACRO IS USED TO "FORCE THE SETTING" OF SPECIFIC WORDS IN THE CURRENT CHANNEL DATA BASE USING THE CORRESPONDING HORDS IN THE JOB STANDARD DATA BASE AS A SOURCE. THE MACRO TAKES AN ARBITRARY LENGTH STRING OF ARGUMENTS ENCLOSED IN ANGLE BRACKETS AND SEPARATED BY COMMAS; EACH ARGUMENT IS ONE OF THE THREE CHARACTER MNEMONICS FOUND IN THE ARGS MACRO. FOR EXAMPLE, FORSET <ARG, DIR> WILL FORCE THE FIRST THO HORDS IN THE LKP-ENT-REN BLOCK FOR THE CURRENT CHANNEL TO BE SET FROM THE JOB STANDARD DATA BASE WHICH HOULD PRESUMBBLY HAVE BEEN SET PREVIOUSLY BY SELARG AND SELDIR MACROS. THE INTENTION OF THIS MECHANISM IS THAT PROCEDURES MAY BE WRITTEN INDEPENDENT OF PARTICULAR UFDS, FILENAMES, STRUCTURES, ETC., AND THEN CALLED (FROM WITHIN SOME OTHER PROCEDURE) AFTER APPROPRIATE SELXXX MACROS.

(3.4 CONT'D)

FINALLY (FOR THIS SECTION), THE INSURE MACRO IS IDENTICAL TO FORSET, EXCEPT THAT THE SPECIFIED DATA BASE ARGUMENTS ARE SET ONLY IF THEY HAVE NOT ALREADY BEEN SET (BY A SETXXX, FORSET OR INSURE MACRO) SINCE THE MOST RECENT RELEASE UUO ON THE CURRENT CHANNEL, A RANDOM FACT WHICH BELONGS FURTHER ALONG IN THIS DOCUMENTATION BUT MIGHT CLARIFY THE USE OF THE INSURE MACRO IS THAT WHENEVER AN OPEN UUO IS EXECUTED FOR A PARTICULAR CHANNEL, FILTST DOES AN AUTOMATIC

INSURE <MOD, STR, BUF>

AND BEFORE ANY UUO WHICH REFERENCES THE LKP-ENT-REN BLOCK, FILTST DOES AN AUTOMATIC

INSURE CARG, DIR, NAM, EXT, PRT>

(THIS DOES NOT IMPLY THAT THE USER CANNOT SET THE NUMBER OF ARGUMENTS FOR LKP-ENT-REN UUOS LESS THAN FOUR).

3.5 SPECIFYING EXPECTATIONS

SO FAR, THE ONLY MACROS DISCUSSED HAVE BEEN FOR MODIFYING AN IN CORE DATA BASE; NONE HAVE RESULTED IN INVOLVING THE MONITOR, FILTST PROCEDURES ARE INTENDED TO TAKE THO PREPARATORY ACTIONS BEFORE EXECUTING ANY MACROS WHICH RESULT IN UUOS, THE FIRST OF THESE ACTIONS IS THE PREPARATION OF THE CHANNEL DATA BASE AS DESCRIBED ABOVE; THE SECOND IS THE PREDICTING OF EXPECTED RESULTS, A SINGLE MACRO, CALLED EXPECT, EXISTS FOR THIS PURPOSE.

EXPECT TAKES THO ARGUMENTS EITHER OF WHICH MAY BE MISSING. THE FIRST OF THESE SPECIFIES RETURN EXPECTATIONS FOR ANY SUBSEQUENT UUOS WHICH HAVE MORE THAN ONE RETURN. THE ARGUMENT MAY BE A SINGLE CHARACTER FROM THE SET GIVEN BELOW, OR A DECIMAL NUMBER. IT IS INTERPRETED AS FOLLOWS:

A	R	G	U	M	E	N	1
---	---	---	---	---	---	---	---

INTERPRETATION

X	EITHER UUD RETURN ACCEPTABLE	
N	NORMAL (SKIP) RETURN EXPECTED	
Ε	ERROR (FIRST) RETURN EXPECTED	BUT
(NUMBER)	ANY ERROR CODE IS ACCEPTABLE ERROR (FIRST) RETURN EXPECTED ERROR CODE MUST BE <number></number>	AND

THIS FIRST ARGUMENT TO EXPECT IS RELEVANT ONLY FOR SUBSEQUENT UUOS OF TWO RETURNS. SINGLE RETURN UUOS DO NOT REQUIRE THIS FORM OF EXPECTATION PREDICTION.

(3.5 CONT'D)

THE SECOND ARGUMENT TO EXPECT IS RELEVANT FOR ALL SUBSEQUENT UUOS. IT SPECIFIES THE EXPECTED STATES OF THE FIVE STATUS BITS RETURNED IN BIT POSITIONS 18 - 22 OF THE GETSTS UUO. UN-LESS ERROR CHECKING IS SUPPRESSED FOR SOME REASON (AS IT USUALLY IS IN CASES WHERE A SINGLE PROCEDURE MACRO REQUIRES THE EXECUTION OF MORE THAN ONE UUO), A GETSTS IS DONE AFTER EVERY OTHER UUO, AND THE FOUR ERROR BITS PLUS THE END-OF-FILE BIT ARE CHECKED AGAINST EXPECTATIONS.

THE MACRO ARGUMENT MUST CONSIST OF STRING OF FIVE CHAR-ACTERS, EACH OF WHICH MUST BE EITHER Ø, 1 OR X. EACH CHARACTER CORRESPONDS TO ONE OF THE FIVE STATUS BITS (FROM LEFT TO RIGHT) WHERE Ø AND 1 SPECIFY THAT THE BIT MUST BE EITHER A ZERO OR A ONE, AND X SPECIFIES THAT EITHER ZERO OR ONE IS ACCEPTABLE FOR THAT BIT.

NOTICE THAT THE EXPECT MACRO IS CHANNEL INDEPENDENT, AND SPECIFIES EXPECTATION FOR ALL SUBSEQUENT UUOS, NO MATTER WHAT CHANNEL THEY ARE EXECUTED ON. IT IS INTENDED THAT EXPECT MACROS BE EXECUTED AS OFTEN AS ECPECTATIONS CHANGE. DURING MOST PARTS OF MOST PROCEDURES, THE EXPECTATIONS ARE LIKLY TO BE

EXPECT N.00000

ONE SUCH MACRO IS SUFFICIENT UNTIL SOME ERROR RETURN OR ERROR BIT IS TO BE EXPECTED. IF EITHER ARGUMENT TO AN EXPECT MACRO IS MISSING (I.E. BLANK), THE PREVIOUS EXPECTATIONS FOR THAT ARGUMENT ARE NOT ALTERED.

3.6 THE EXECUTE MACROS

ONCE THE DATA BASE FOR A PARTICULAR CHANNEL AND THE APPROPRIATE EXPECTATIONS HAVE BEEN ESTABLISHED BY MEANS OF SETXXX (OR SELXXX AND FORSET) AND EXPECT MACROS, IT IS THEN REASONABLE TO PROVOKE ACTION BY MEANS OF THE XCTXXX MACROS, WITH THE EXCEPTION OF INPUT AND OUTPUT WHICH ARE DESCRIBED IN DETAIL BELOW, THERE IS ONE SIMPLE XCT MACRO FOR EACH OF THE POSSIBLE UUOS, FOR THE UUOS OPEN (INIT IS NEVER USED), LOOKUP ENTER, RENAME, SEARCH, SEEK AND RELEASE, THE CORRESPONDING MACROS ARE XCTOPN, XCTLKP, XCTENT, XCTREN, XCTSRC, XCTSEK, AND XCTRLS, NONE OF THESE MACROS TAKE ARGUMENTS SINCE THE PROPER CHANNEL NUMBER IS DETERMINED BY THE MOST RECENT SELCHN MACRO, AND ALL OTHER PARAMETERS HAVE BEEN DETERMINED BY PREVIOUS PREPARATORY MACROS (AS DESCRIBED IN THE PARAGRAPHS ABOVE).

THE UUCS USETO, USETI AND CLOSE ARE ACCOMPLISHED BY XCTSTO, XCTSTI AND XCTCLS MACROS, THESE THREE MACROS MAY EACH TAKE A SINGLE NUMERIC ARGUMENT (INTERPRETED AS DECIMAL); TO SPECIFY THE RELATIVE BLOCK NUMBERS IN XCTSTO AND XCTSTI MACROS, AND TO OPTIONALLY SPECIFY THE ADDRESS FIELD OF THE CLOSE UUC (WHEREBY ONE SIDE OR THE OTHER OF A BI-DIRECTIONAL OPERATION CAN BE CLOSED).

EACH OF THESE XCTXXX MACROS GENERATES A PUSHT CALL TO A ROUTINE WHICH SETS UP AND EXECUTES FROM WITHIN THE ACS THE PROPER UUD FOR THE CURRENT CHANNEL, THEN PERFORMS ALL EXPECTATION CHECKING WITH ERROR MESSAGES AND DIAGNOSTIC OPERATIONS INVOKED AS APPROPRIATE AND FINALLY, TURNS OFF ANY STATUS BITS WHICH COME ON FOR THAT CHANNEL, AND RETURNS TO THE NEXT MACRO IN THE CURRENT PROCEDURE.

3,7 READ AND WRITE OPERATIONS

FOUR MACROS EXIST TO ALLOW EASY SPECIFICATION OF INPUT AND OUTPUT OPERATIONS. EACH OF THESE MACROS CAN RESULT IN AN ARBITRARY NUMBER OF INPUT OR OUTPUT UUOS BEING EXECUTED, THE FOUR MACROS ARE

REDNXT N, P - "READ NEXT" N WORDS; EXPECT DATA
PATTERN P,
WRYNXT N, P - "WRITE NEXT" N WORDS IN DATA PATTERN P,
REDSPC N, B, P - "READ SPECIFIC" N WORDS STARTING WITH
FIRST WORD OF RELATIVE BLOCK B;
EXPECT DATA PATTERN P,
WRTSPC N, B, P - "WRITE SPECIFIC" N WORDS STARTING
WITH FIRST WORD OF RELATIVE BLOCK B,
IN DATA PATTERN P,

THE ARGUMENT N IS GIVEN IN HORDS RATHER THAN BLOCKS SO THAT PARTIAL BLOCKS MAY BE READ AND WRITTEN. THE ARGUMENT B IS A (DECIMAL AS USUAL) RELATIVE BLOCK NUMBER IN THE CURRENT FILE. THE DATA PATTERN IS ALSO A DECIMAL ARGUMENT WHICH SHOULD BE A NUMBER BETWEEN Ø AND 255. THIS IS BECAUSE THE ARGUMENT SUPPLIED IS TRUNCATED TO 8 BITS, AND THEN REPRODUCED FOUR TIMES IN A 36 BIT WORD. THE RESULTING WORD IS WRITTEN (OR EXPECTED) IN A PARTICULAR POSITION IN EACH BLOCK OF THE FILE BEING WRITTEN OR READ. A DATA PATTERN ARGUMENT OF Ø IS A SPECIAL CASE SPECIFYING THAT DATA PATTERNS ARE NOT TO BE CHECKED UPON INPUT.

IT IS SOMETIMES USEFUL FOR SOME OR ALL OF THE ARGUMENTS TO RED OR HRT MACROS TO BE MISSING, TO ALLOW FOR THIS POSSIBILITY, THREE ADDITIONAL HORDS ARE PART OF EACH CHANNEL
DATA BASE (AND THE JOB STANDARD DATA BASE), THEY ARE THE
LAST THREE ENTRIES IN THE ARGS MACRO (NAMELY: NRB, XFW,
AND PAT) AND STAND FOR "NEXT RELATIVE BLOCK" (TO READ OR WRITE),
"TRANSFER WORDS" (I.E. NUMBER OF WORDS TO READ OR HRITE),
AND "DATA PATTERN," THESE LOCATIONS ARE SET IN THE USUAL
MANNER HITH SETXXX (AND SELXXX) MACROS AND ONE REFERENCED BY
THE RED AND HRT MACROS WHENEVER (ONLY IF) THE CORRESPONDING
ARGUMENTS WERE NOT SUPPLIED, FOR EXAMPLES, SOME OF THE MANY
EQUIVALENT MACRO SEQUENCES TO ACCOMPLISH THE HRITING OF
BLOCKS 3, 4, AND 5 OF A FILE IN DATA PATTERN 2 MIGHT BE:

WRTSPC 3*BL, 3, 2
(OR)
SETNRB 3
SETPAT 2
WRTSPC 3*BL
(OR)

(3.7 CONT'D)

SELNRB 3
SELXFW 3*BL
SELYFW 2
FORSET < NRB, XFW, PAT>

(OR)
SETPAT 2
XCTSTO 3
WRTNXT 3*BL
(ETC.)

THE MECHANISM BY WHICH I/O IS ACCOMPISHED DEPENDS UPON THE DATA MODE, PRIOR TO ANY XCTOPN, THE DATA MODE MUST HAVE BEEN SELECTED BY A SETMOD (OR SELMOD) MACRO, MOD IS ONE OF THE ENTRIES DECLARED IN THE ARGS MACRO TO HAVE UNUSUAL ARGUMENTS, BASICALLY, ALL I/O IS DONE IN EITHER BINARY (14) OR DUMP (17) MODE; HOWEVER, 3 DIFFERENT BINARY MODES ARE AVAILABLE; BINARY INPUT ONLY (BI), BINARY CUTPUT ONLY (BO), AND BINARY BOTH (BB), THE SYMBOLS BI, BO, BB AND DM (WHICH STANDS FOR DUMP MODE) ARE DEFINED IN FILTST TO BE USED AS THE SET OF ARGUMENTS TO CHOOSE AMONG FOR SETMOD AND SELMOD MACROS, ACTUALLY BB MODE CAN ALWAYS BE USED IN PLACE OF BI OR BO; THE ONLY DIFFERENCE IS THAT TWO BUFFER HEADERS ARE ESTABLISHED IN BB MODE (I.E. BOTH SIDES OF THE BUF ENTRY IN THE DATA BASE ARE SET).

ÎN BÎNARY MODE, DOUBLE BUFFERING IS ALWAYS USED (BUFFERS ARE ASSEMBLED INTO EACH PER-CHANNEL DATA BASE), AND THE USUAL OVERLAPPING OF I/O WITH COMPUTATION IS MAINTAINED,

IN DUMP MODE, WITH SPACE FOR TWO INPUT AND TWO OUTPUT BUF-FERS AVAILABLE, EACH OPERATION IS AUTOMATICALLY BROKEN INTO SOME NUMBER (POSSIBLY ZERO) OF 512 WORD TRANSFERS FOLLOWED (POSSIBLY) BY ONE LAST TRANSFER OF LESS THAN 512 WORDS,

3.8 DEFINING PROCEDURES

THE REMAINING MACROS (IMPLEMENTED TO DATE) IN FILTST ARE USED FOR DEFINING AND CALLING TEST PROCEDURES.

ALL TEST PROCEDURES HAVE NAMES. THESE NAMES HAVE TWO PARTS EACH OF WHICH MAY BE ONE OR THO CHARACTERS LONG; THE THO PARTS ARE SEPARATED BY A COMMA. THIS CONVENTION OF TWO PART NAMES, CONTAINING NO MORE THAN FOUR CHARACTERS TOTAL, SEEMED A GOOD COMPROMISE BETWEEN THE NEED TO RECOGNIZE PROCEDURE FUNCTIONS EASILY FROM THEIR NAMES, AND THE NEED TO GENERATE UNIQUE SYMBOLS FOR EACH PROCEDURE. NO PARTICULAR CONVENTIONS ARE RECOMMENDED FOR NAMING PROCEDURES EXCEPT THAT NAMES SHOULD SUGGEST THE LIKELY "LEVEL" OF THE TEST PROCEDURE; THAT IS, SINCE PROCEDURES CAN CALL EACH OTHER RECURSIVELY, IT SQUITE CONVENIENT TO WRITE AN EXPANDING SET OF GENERAL PURPOSE "INNER" PROCEDURES AND TO BUILD LEVELS OF "OUTER" PROCEDURES WHICH CALL THEM; NAMES SHOULD REVEAL AT LEAST WHICH OF THE PROCEDURES ARE OUTERMOST,

THE MACRO PROCED MUST BE THE FIRST IN ANY PROCEDURE, AND DEFINES ITS NAME; THE TWO ARGUMENTS TO PROCED ARE THE TWO PARTS OF THE PROCEDURE NAME, FOR EXAMPLE, AMONG THE SAMPLE PROCEDURES WRITTEN SO FAR FOR FILTST IS ONE WHICH BEGINS

PROCED MT, UB

THE MNEMONIC IS INTENDED TO SUGGEST "MAIN TEST" (MEANING OUTERMOST LEVEL), "UPDATE BACKWARDS," AS THE COMMENTS REVEAL, THIS PROCEDURE UPDATES MULTIPLE BLOCKS OF DECREASING RELATIVE BLOCK NUMBER. THE PROCED MACRO GENERATES THE CODE WHICH MAINTAINS THE ERROR TRACE PUSH DOWN STACK AND ENTRY COUNTS FOR THE PROCEDURE, AND GENERATES THO SYMBOLS OF THE FORM

X.N1N2 AND C.N1N2

WHERE N1 AND N2 ARE THE THO PARTS OF THE PROCEDURE NAME, THE FIRST SYMBOL IS THE PROCEDURE ENTRY POINT AND THE SECOND LABELS THE REGISTER WHERE CALLS TO THIS PROCEDURE ARE COUNTED, ALL PROCEDURES MUST END WITH THE MACRO ENDPR WHICH TAKES NO ARGUMENTS, BLOCKS WHICH BEGIN WITH PROCED AND END WITH ENDPR MAY BE INSERTED IN ANY ORDER WITHIN THE AUXILLIARY FILE (ASSEMBLED WITH FILTST) SINCE CONTROL NEVER FALLS FROM ONE INTO THE NEXT.

3.9 CALLING PROCEDURES

TWO MACROS EXIST FOR CALLING PROCEDURES FROM WITHIN OTHER PROCEDURES, (A SEPARATE MECHANISM EXISTS FOR CALLING OUTERMOST PROCEDURES INITIALLY AS EXPLAINED BELOW,) THE MACRO CALLPR TAKES TWO ARGUMENTS WHICH, AS IN THE CASE OF PROCED, ARE THE TWO PARTS OF A PROCEDURE NAME, CALLLPR SIMPLY GENERATES A PUSHJ TO THE ENTRY POINT X,N1N2.

A RELATED MACRO, RPCALL ("REPEAT CALL"), IS USED TO CALL PROCEDURES MORE THAN ONCE. IT TAKES A THIRD ARGUMENT WHICH IS A DECIMAL COUNT OF THE NUMBER OF TIMES TO CALL THE PROCEDURE. IF THIS ARGUMENT IS MISSING, THE VALUE IS TAKEN INSTEAD FROM THE CONTENTS OF YET ANOTHER WORD IN THE CURRENT CHANNEL DATA BASE; THIS WORD IS DEFINED BY THE MNEMONIC REP IN THE ARGS MACRO, AND IS SET AS USUAL BY MEANS OF THE SETREP (OR SELREP AND FORSET) MACROS.

RPCALL IS THE MEANS BY WHICH "LOOPS" ARE ACCOMPLISHED. ANY SEQUENCE OF MACROS TO BE INCLUDED IN A LOOP IS DECLARED TO BE A SEPARATE PROCEDURE AND CALLED THE APPRPRIATE NUMBER OF TIMES BY A RPCALL MACRO WITHIN SOME OTHER PROCEDURE, THE "TALLY" CONCEPT USUALLY ASSOCIATED WITH LOOPS IS OCCASIONALLY USEFUL WITHIN FILTST PROCEDURES; INCREMENT AND DECREMENT OPERATIONS WHEN NEEDED ARE ACCOMPLISHED BY MEANS OF DIRECT PDP-10 INSTRUCTIONS AS FOLLOWS:

3.10 PROCEDURE STEPS WHICH ARE NOT FILTST MACROS:

SO FAR ALL DISCUSSION OF THE FILTST DATA BASE HAS INVOLVED SETTING LOCATIONS WITHIN IT. THESE LOCATIONS CAN BE REFERENCED, CHECKED, INCREMENTED, ETC., BY MEANS OF DIRECT POP-18 INSTRUCTIONS. FIVE ACCUMULATORS MAY BE OF INTEREST TO USERS WRITING TEST PROCEDURES:

ACCUMULATORS "A", "B" AND "C" ARE GUARANTEED TO BE PRESERVED BY ALL CODE GENERATED OR CALLED BY FILTST MACROS AND ARE THEREFORE AVAILABLE TO BE USED WITHIN TEST PROCEDURES, IF THE USER FEELS IT NECESSARY TO PRESERVE THESE ACS IN "INNER" PROCEDURES WHICH MIGHT USE THEM, PUSH AND POP INSTRUCTIONS CAN BE USED WITH ACCUMULATOR "P", FINALLY ACCUMULATOR "D" ALWAYS POINTS TO THE DATA BASE FOR THE CURRENT USER CHANNEL (SET BY THE MOST RECENT SELCHN MACRO); EACH OF THE MNEMONICS IN THE ARGS MACRO GENERATES A SYMBOL OF THE FORM RIBXXX WHICH WHEN INDEXED BY D WILL REFERENCE THAT PARTICULAR ENTRY IN THE CURRENT CHANNEL DATA BASE, ("RIB" WAS CHOSEN BECAUSE MANY, BUT NOT ALL, OF THE ENTRIES IN EACH DATA BASE CORRESPOND TO ENTRIES IN A FILES RETRIEVAL INFORMATION BLOCK.)

(3.10 CONT'D)

THUS, FOR EXAMPLE, THE INSTRUCTION SEQUENCE

MOVE1 A,5 ADDM A,RIBNRB (D)

WILL ADD 5 TO THE "NEXT RELATIVE BLOCK" NUMBER IN THE CURRENT CHANNEL DATA BASE; THE NEW VALUE WILL BE USED WHEN THE NEXT REDSPC OR WRISPC MACRO IS EXECUTED (PROVIDED ITS SECOND ARGUMENT IS MISSING IN THE CALL).

REGISTERS WITHIN THE "JOB STANDARD" DATA BASE MAY BE REFERENCED AS SYMBOLIC LOCATIONS USRXXX WHERE XXX MATCHES ANY MNEMONIC IN THE ARGS MACRO; (NO INDEX REGISTER IS USED IN REFERENCES TO LOCATIONS USRXXX).

3.11 THE TEST TABLE:

IN ADDITION TO A COLLECTION OF SEPARATE PROCEDURE DEFINITIONS IN NO PARTICULAR ORDER, THE AUXILLIARY FILE ASSEMBLED WITH FILTST MUST CONTAIN A TABLE WHOSE STARTING LOCATION IS TESTS AND WHOSE CONTENTS DEFINE THE ORDER IN WHICH THE OUTERMOST LEVEL OF TEST PROCEDURES ARE TO BE CALLED WHEN FILTST IS RUN.

ONE MACRO, CALLED DO, IS USEFUL FOR SPECIFYING ENTRIES IN THE TESTS TABLE. ITS FIRST TWO ARGUMENTS ARE THE TWO PARTS OF THE NAME OF SOME PROCEDURE TO BE EXECUTED, AND ITS THIRD ARGUMENT, IF PRESENT, IS A DECIMAL COUNT OF THE NUMBER OF TIMES THAT PROCEDURE IS TO BE EXECUTED BEFORE THE NEXT ENTRY IN THE TESTS TABLE IS SEEN. THE TESTS TABLE IS THERFORE A LIST OF DO MACROS AND MUST BE FOLLOWED BY A WORD CONTAINING ZERO. WHEN THE ZERO WORD IS ENCOUNTERED DURING EXECUTION, THE LIST OF TESTS IS REPEATED FROM THE BEGINNING, MORE TAN TESTS TABLE CAN BE FOUND IN THE FILTST LISTING ON THE PAGE WHEREON THE SYMBOL DOTEST IS DEFINED. USE OF THE DO MACRO RESULTS IN THE GENERATION OF COMMENTS IN THE LISTING WHICH NUMBER THE ENTRIES IN THE TEST TABLE FOR EAST IDENTIFICATION DURING DEBUGGING.

THE ONLY OTHER CONSTRUCTION WHICH MUST BE PART OF THE AUX-ILLIARY FILE ASSEMBLED WITH FILTST ARE THE TWO LINES;

> LSTECT : XWD ZCHAIN,Ø AND END START

THE FIRST OF THESE SPECIFIES THE END OF A CHAIN LIST THROUGH WHICH THE ENTRY COUNTS OF ALL PROCEDURES ARE LINKED (SO THAT THEY MAY BE CLEARED AT APPROPRIATE TIMES). THE FILTST STARTING ADDRESS IS START, DEFINED NEAR THE END OF THE MAIN FILTST FILE.

4. FILTST OPERATION

4.1 THE ERROR TRACE

UPON ANY ERROR MESSAGE (AND WHENEVER THE W COMMAND IS TYPED - SEE BELOW) A PRINTOUT OF THE CURRENT TRACE STACK IS GENERATED. THE TRACE SHOWS WHAT STEP OF WHAT PROCEDURE WAS BEING EXECUTED WHEN THE ERROR OCCURRED, AND BY EXACTLY WHAT PATH CONTROL HAD REACHED THAT POINT. THE TRACE BEGINS WITH THE CURRENT INDEX INTO THE TESTS TABLE (PRINTED IN OCTAL SINCE THE DO MACRO NUMBERS THE ENTRIES IN OCTAL IN THE LISTING). A DECIMAL NUMBER IS GIVEN IN PARENTHESIS WITH EACH PROCEDURE NAMED IN THE TRACE; IT IS THE NUMBER OF TIMES THAT PROCEDURE HAS BEEN CALLED SINCE THE TESTS TABLE INDEX WAS INCREMENTED TO ITS PRESENT VALUE. THAT IS, THE ENTRY COUNTS FOR ALL PROCEDURES ARE CLEARED WHENEVER ANY ENTRY IN THE TESTS TABLE HAS BEEN COMPLETED. (SINCE ENTRY COUNTS ARE PART OF THE "PURE" PROCEDURE DEFINITIONS IN FILTST'S HIGH SEGMENT, THIS FEATURE IS MOST USEFUL WHEN ONLY A SINGLE JOB IS USING THE HIGH SEGMENT,) AS AN EXAMPLE, THE TRACE:

5 RD,DL -- 9 (1) / OP,RD -- 3 (2)

INDICATES THAT CONTROL IS CURRENTLY AT STEP 3 OF PROCEDURE OP,RD (AND THAT THIS IS THE SECOND CALL TO OP,RD). IT SAYS THAT OP,RD WAS CALLED BY STEP 9 OF PROCEDURE RO,DL (DURING THE FIRST CALL TO RO,DL), AND THAT RD,DL WAS CALLED DIRECTLY AS A RESULT OF THE DO MACRO COMPRISING THE FIFTH ENTRY IN THE TESTS TABLE. NOTE THAT ONLY THOSE PROCEDURE STEPS WHICH ARE FILTST MACROS ARE COUNTED AS STEPS; IN DETERMINING WHAT LINE OF A PROCEDURE CORRESPONDS TO WHAT STEP, ONE MUST NOT COUNT ANY LINES COMPRISING BASIC PDP-10 INSTRUCTIONS.

ANY FURTHER INFORMATION REQUIRED FOR ANALYSIS OF THE PROBLEM (IF THE TRACE WAS PRODUCED AS THE RESULT OF SOME PROBLEM) MUST BE OBTAINED THROUGH DDT WHICH IS TYPICALLY LOADED WITH FILTST.

4.2 FILTST COMMANDS

WHEN FILTST IS RUNNING, IT ACCEPTS A SET OF SINGLE CHARACTER COMMANDS WHICH MAY BE TYPED AT ANY TIME, THE CONSOLE INPUT BUFFER IS CHECKED FOR THE PRESENCE OF COMMAND CHARACTERS AFTER EVERY UUO IS EXECUTED, SOME COMMANDS ARE PROCESSED WITHOUT STOPPING THE TEST SEQUENCE IN PROGRESS; OTHERS INTERRUPT THE RUNNING OF FILTST IN CONVENIENT WAYS, THE PAGE OF THE FILTST LISTING ON WHICH THE SYMBOL COMTAB IS DEFINED DESCRIBES HOW NEW COMMANDS MAY BE ADDED; THOSE WHICH HAVE BEEN IMPLEMENTED TO DATE ARE DESCRIBED IN THE PARAGRAPHS BELOW, AND SUMMARIZED IN APPENDIX LL.

AS MENTIONED ABOVE, THE COMMAND W (MNEMONICS FOR "WHERE" ARE WET) MAY BE TYPED AT ANY TIME; WHEN CONTROL RETURNS FROM THE NEXT UUD, THE TRACE STACK WILL BE PRINTED SO THAT, BY REFERENCE TO THE AUXILLIARY FILE LISTING, THE USER CAN DETERNINE HOW FAR THE TEST SEQUENCE HAS PROGRESSED. ERROR MESSAGES CONSIST OF AN ERROR NUMBER OF THE FORM EXX AND THE TEXT OF THE MESSAGE. OUTPUT CAN BE ABBREVIATED TO THE ERROR NUMBER ALONE BY MEANS OF THE A COMMAND; THE "LONG" FORM CAN BE RE-ENABLED BY MEANS OF THE L COMMAND.

4.3 FILTST AND DDT

IT IS INTENDED THAT DDT BE LOADED WITH FILTST FOR INTERACTIVE INVESTIGATION OF OBSCURE ERRORS, IT IS FURTHER INTENDED THAT A DDT BREAKPOINT BE INSERTED AT LOCATION BREAK IN FILTST'S LOW SEGMENT, INSERTING A BREAKPOINT AT THIS LOCATION, WHICH SOTHERHISE INITIALIZED TO CONTAIN A POPJ INSTRUCTION, ENABLES THO OTHER USEFUL FILTST COMMANDS, FILTST CAN BE MADE TO EXECUTE A PUSHJ TO BREAK, WHICH WILL THEN ENTER DDT VIA THE BREAK-POINT, AT TWO PREDICTABLE TIMES. THE "SPACE" COMMAND (THE CHARACTER "SPACE") WILL CAUSE THE PUSHJ TO BE EXECUTED AS SOON AS THE COMMAND IS PROCESSED - THAT IS, AS SOON AS THE NEXT UUD IS EXECUTED, THE S (MNEMONIC FOR "STOP") COMMAND WILL CAUSE THE PUSHJ TO BREAK WHEN THE TEST PROCEDURE INDICATED IN THE CURRENT POSITION OF THE TESTS TABLE IS COMPLETE. THAT IS, S WILL STOP FILTST WITH NO PROCEDURE IN PROGRESS AS IT IS JUST ABOUT TO BEGIN ANOTHER "OUTERMOST" PROCEDURE. NEITHER THE "SPACE" NOR THE S COMMAND HAVE ANY EFFECT IF A BREAKPOINT HAS NOT BEEN PLACED AT LOCATION BREAK.

4.4 AFTER AN ERROR MESSAGE

EXCEPT AFTER AN ERROR MESSAGE, FILTST COMMANDS ARE PROCESSED WHENEVER THEY ARE TYPED, BUT NONE ARE EVER REQUIRED, AFTER AN ERROR MESSAGE HOWEVER, AT LEAST ONE OF THE "ACTION TYPE" COMMANDS IS REQUIRED AND IS WAITED FOR. IN THE TABLE OF COMMANDS (COMTAB IN FILTST LISTING), TWO COMMANDS ARE CURRENTLY FLAGGED AS ACTION COMMANDS; ONE OR THE OTHER OF THESE MUST BE TYPED THE USER AFTER ANY ERROR. ONE IS THE "SPACE" COMMAND WHICH CAUSES DDT TO BE ENTERED (AS DESCRIBED ABOVE) SO THAT THE ERROR MAY BE INVESTIGATED; THE OTHER IS THE "C" (FOR "CONTINUE") COMMAND WHICH CAUSES FILTST TO PROCEDE AND IGNORE THE ERROR. IT IS INTENDED TO BE POSSIBLE TO CONTINUE FROM ANY ERROR THAT HIGHT OCCUR WITH INTERNAL CONDITIONS SET AS THEY WOULD HAVE BEEN HAD THE ERROR NOT OCCURRED. TYPING C MAY WELL RESULT IN OTHER RELATED ERRORS BEING DETECTED, BUT AT LEAST WILL NOT LOOP ON A SINGLE ERROR. IT IS HOPED THAT WHEN AN ERROR DOES OCCUR, THE ERROR TRACE STACK (PRINTED AUTOMATICALLY), WILL BE SUFFICIENT INFORMATION FOR ANALYSIS OF THE PROBLEM, (IN CONJUNCTION HITH THE FILTST LISTING), AND THAT TYPING "C" WILL RESULT IN A SUCCESSFUL "CONTINUE" SUCH THAT FURTHER ERRORS WHICH OCCUR WILL BE SEPARATE SITUATIONS FOR LATER ANALYSIS. THE "C" COMMAND HAS NO EFFECT IF TYPED WHILE FILTST IS RUNNING, ALL CHARACTERS WHICH ARE NOT COMMANDS (INCLUDING CARRIAGE RETURN AND LINE FEED) ARE IGNORED.

4.5 DDT TECHNIQUES

THE FILTST LISTING SHOULD BE CONSULTED FOR COMPLETE INFORMATION ON INTERNAL STRUCTURE, ESPECIALLY PAGE 3 WHEREON THE IMPURE DATA BASE IS DEFINED. A FEW REGISTERS IN THE DATA BASE WERE INCLUDED SPECIFICALLY FOR DEBUGGING PURPOSES; THEIR SPECIAL FUNCTIONS ARE EXPLAINED MORE FULLY HERE THAN IN THE LISTING COMMENTS.

ACCUMULATORS OF SPECIAL INTEREST DURING DEBUGGING ARE:

P - THE CONTROL PUSH-DOWN POINTER

TR - THE TRACE STACK PUSH-DOWN POINTER

D - POINTER TO THE DATA BASE FOR THE CURRENT

USER CHANNEL

U - ALWAYS CONTAINS THE LAST UUO EXECUTED

LOCATION TRLAST CONTAINS THE NAME OF THE LAST PROCEDURE SUCCESSFULLY COMPLETED (LOADED BY EVERY ENDPR MACRO), THE TWO HALVES OF THE PROCEDURE NAME ARE IN LEFT JUSTIFIED 7-BIT ASCII IN THE THO HALVES OF THE WORD - A RATHER INCONVENIENT FORMAT FOR ODT, UNFORTUNATELY.

(4.5 CONT'D)

THREE LOCATIONS IN EACH CHANNEL DATA BASE (NO NEED FOR THEM TO BE PART OF "JOB STANDARD" DATA BASE) ARE OF SPECIAL INTEREST FOR DEBUGGING:

LOCATION CHNCNT CONTAINS IN ITS LEFT HALF A SET OF BITS, ONE BIT FOR EACH OF THE POSSIBLE UUOS, SHOWING WHICH UUOS HAVE BEEN EXECUTED ON THIS CHANNEL. IN THE RIGHT HALF, THERE IS A COUNT OF THE NUMBER OF UUOS WHICH HAVE BEEN EXECUTED ON THIS CHANNEL (TO ACCOUNT FOR THE FACT THAT SOME UUOS MAY HAVE BEEN EXECUTED SEVERAL TIMES), CHNCNT IS INITIALIZED TO ZERO JUST BEFORE ANY OPEN UUO IS EXECUTED ON THAT CHANNEL SO THAT THE CHANNEL HISTORY REMAINS EVEN AFTER A RELEASE UUO.

COCATION CHNARG HAS A BIT POSITION FOR EACH OF THE ENTRIES IN THE ARGS MACRO; THAT IS, FOR EVER DATA BASE ENTRY FOR WHICH THERE IS A SETXXX MACRO. IT IS INITIALIZED TO ZERO UPON ANY RELEASE UUD, AND IS USED TO REMEMBER WHICH ENTRIES MAVE BEEN SET (BY SETXXX OR FORSET OR INSURE) SINCE THE RELEASE. CHNARG IS USED BY THE INSURE MACRO TO DETERMINE WHICH ENTRIES MUST BE SET FROM THE JOB STANDARD DATA BASE.

COCATION CHNCRB ALWAYS CONTAINS THE "CURRENT RELATIVE BLOCK" NUMBER WHICH FILTST EXPECTS TO READ OR WRITE NEXT. IT IS INCREMENTED ON XCTSTO MACRO, BUT MORE IMPORTANTLY, IT IS INCREMENTED ON EVERY INPUT OR OUTPUT UND DONE BY FILTST, ITS CONTENTS ARE WRITTEN INTO ANY OUTPUT BLOCK AND CHECKED UPON READING ANY INPUT BLOCK, THAT IS, AMONG OTHER THINGS EVERY BLOCK OF ANY FILE CREATED BY FILTST CONTAINS ITS OWN RELATIVE BLOCK NUMBER, IF THE ERROR MESSAGE "INCORRECT RELATIVE BLOCK NUMBER IN INPUT DATA" APPEARS, THE USER CAN FIND THE EXPECTED NUMBER IN CHNCRB AND THE ACTUAL NUMBER IN THE CURRENT INPUT BUFFER (AS THE IMPURE DATA BASE DEFINITION IN FILTST LISTING WOULD REVEAL, LOCATION IBHBLK IN THE CHANNEL DATA BASE — FOUND THRU ACCUMULATOR D — IS THE INPUT BUFFER HEADER POINTER; THE RELATIVE BLOCK NUMBER IS THE FIRST DATA WORD IN ANY BUFFER AS THE TABLE AT LOCATION ITMLST WOULD REVEAL).

NOTE THAT ALL OF THE ABOVE SYMBOLIC LOCATIONS ARE RELATIVE TO THE CURRENT CHANNEL DATA BASE. USING DDT, ONE FINDS THE CURRENT DATA BASE BY TYPING D/ AND THEN PERHAPS \$Q<DB: SUCH THAT FROM THEN ON ONE CAN TYPE DB+CHNCRB/ ETC.

5. FEATURES YET TO BE IMPLEMENTED

A NUMBER OF FEATURES PLANNED FOR FILTST ARE NOT IMPLEMENTED AS OF THIS WRITING. THEIR ABSENCE DOES NOT PRECLUDE THE USE OF FILTST AS AN EFFECTIVE TEST VEHICLE IN ITS PRECENT STATE; HOWEVER, SINCE THE STRUCTURE OF THE PRESENT VERSION IN SOME WAYS REFLECTS THE ANTICIPATED INCLUSION OF THESE FEATURES IT IS WELL FOR ANYONE WHO MIGHT MODIFY THE PRESENT VERSION TO HAVE CONSIDERED THE FOLLOWING POINTS:

1. MULTI-JOB FEATURES: SOME COORDINATED TESTS CAN BE PERFORMED ONLY WITH TWO (OR MORE) JOBS ACTING IN A SYNCHRONOUS FASHION ON THE SAME FILES. IT IS PLANNED THAT FILTST INCLUDE AN OPTION TO ESTABLISH ONE (OR MORE) ADDITIONAL JOBS THROUGH THE PSEUDO-TELETYPE TO SYNCHRONIZE THE ACTIVITY OF THIS SLAVE JOB WITH THE MAIN JOB.

A SIMPLE MECHANISM TO ACCOMPLISH THIS SYNCRONIZATION MIGHT INVOLVE THO SEPARATE TESTS TABLES, ONE TO DRIVE EACH OF THE JOBS, WITH ALL PROCEDURES BEING SHARED AS USUAL, A SINGLE MACRO MIGHT BE DEFINED FOR INCLUSION IN EITHER TESTS TABLES WHICH SAYS IN EFFECT: "PUT THIS JOB INTO IDLE (SLEEP LOOP) AND START THE OTHER JOB AGAIN". THE THO JOBS WOULD NOT RUN IN PARALLET, BUT RATHER IN SEE-SAW FASHION TO ACCOMPLISH SYNCHRONIZED ACTIONS. (THE EFFECT OF MULTIPLE COPIES OF FILTST RUNNING TO CREATE AN INTERESTINGLY HEAVY LOAD IS EASILY ACHIEVED WITH THE PRESENT VERSION OF FILTST BY RUNNING MULTIPLE JOBS, SHOWING THE HIGH SEGMENT, AND STARTING EACH WITH A DIFFERENT INITIAL OFFSET INTO THE TESTS TABLE.)

THE MAJOR REASON WHY MULTI-JOB FEATURES HAVE NOT YET BEEN IMPLEMENTED IS THE TIME REQUIRED TO DESIGN AND IMPLEMENT THE CODE WHICH DEALS WITH THE PSEUDD-TELETYPE AND WHICH HANDLES THE PRINTING OF ERROR MESSAGES (AND THE SUBSEQUENT COMMAND INPUT) FOR THE JOB(S) BEING CONTROLLED BY THE PTY(S).

2. CURRENTLY THE TWO MACROS XCTSRC (SEARCH UUO) AND XCTSEK (SEEK UUO) ARE NOT CODED, THEY PRESENT NO DIFFICULTY BUT WERE NOT USEFUL IN DEBUGGING FILTST UNDER LEVEL C DISK SOFTWARE,

(5, CONT'D)

- THERE SHOULD BE A PRIVILEGED UND IMPLEMENTED IN THE MONITOR WHEREBY A PRIVILEGED JOB COULD CHANGE THE PROJECT PROGRAMMER NUMBERS IT WAS "LOGGED IN UNDER", THEN A FILTST MACRO SHOULD BE DEFINED TO EXECUTE THIS UND (E.G., CNGPPN PJ, PG) SO THAT FILTST PROCEDURES COULD BE WRITTEN TO TEST THE VARIOUS FILE PROTECTION FEATURES OF THE MONITOR,
- 4. AS PART OF ITS INITIALIZATION, FILTST COULD, AND PROBBABLY SHOULD, CREATE UFDS FOR ALL OF THE ENTRIES IN DIR.XX TABLE IN EACH OF THE STRUCTURES IN THE STR.XX TABLE, IF SUCH UFDS DID NOT ALREADY EXIST. THIS ACTION WOULD REQUIRE THAT FILTST BE ABLE TO TEMPORARILY ASSUME MASTER FILE PRIVILEGES AS IT COULD DO WITH THE CNGPPN MACRO IN 3 ABOVE.
- 5. RATHER THAN ASSEMBLING INTO FILTST THE VARIOUS OPTIONS AVAILABLE TO TEST PROCEDURES FOR THOSE DATA BASE ARGUMENTS OF MORE THAN 18 BITS, THESE TABLES (XXX,YY) COULD BE SET CONVERSATIONALLY BY MEANS OF AN INITIALIZATION DIALOGUE.
- FINALLY, NO REASON HAS BEEN FOUND SO FAR FOR FILTST TO DO ANY OF THE FOLLOWING; IT SEEMS HOWEVER, THAT THE FACT THAT FILTST DOES NOT FIND ANY REASON TO DO THESE THINGS SHOULD BE MENTIONED,
 - A. USE THE UUD WHICH ALLOWS SETTING AND/OR INTERROGATING A JOBS FILE SEARCHLIST.
 - B. USE THE UUGS WHICH ALLOW INTERROGATING WHICH FILESTRUCTURES EXIST OR OBTAINING THEIR CHARACTERISTICS.
 - C. ATTEMPT TO REMEMBER THE STATES (GONTENTS) OF THE VARIOUS UPDS IN THE DIR.XX TABLE.
 - D. ALLOW ANY ABILITY TO INTRODUCE RANDOMNEOS INTO TEST PROCEDURES.

- 6, APPENDIX I FILTST MACROS AND THEIR ARGUMENTS
 - MACRO ARGUMENTS SHOWN BELOW ARE TO BE INTERPRETED AS FOLLOWS:
 - N ANY DECIMAL INTEGER
 - A ONE OR TWO CHARACTERS CORRESPONDING TO THOSE CHARACTERS FOLLOWING THE PERIOD IN A TABLE LOCATION OF THE FORM XXX,XX WITHIN FILTST
 - 0 ANY OCTAL INTEGER
 - M ANY ONE OF THE SYMBOLS BI, BO, BB OR DM
 - IST A STRING OF THREE CHARACTER MNEMONICS (FOUND WITHIN THE ARGS MACRO IN FILTST) SEPARATED BY COMMAS AND ENCLOSED IN ANGLE BRACKETS
 - R ONE OF THE CHARACTERS N, E, X OR ANY DECIMAL INTEGER
 - S A STRING OF FIVE CHARACTERS FROM THE SET X, & OR 1
 - L ANY SINGLE CHARACTER OR ANY TWO CHARACTERS
 - A PERIOD AS PART OF ANY ARGUMENT INDICATES THAT THE ARGUMENT MAY BE MISSING. THE ABSENCE OF A PERIOD INDICATES THAT THE ARGUMENT MUST BE PRESENT
 - AN ASTERISK FOLLOWING A MACRO INDICATES THAT THE MACRO IS CHANNEL INDEPENDENT. THE ABSENCE OF AN ASTERISK INDICATES THAT THE MACRO PERTAINS TO THE CHANNEL DECLARED BY THE MOST RECENTLY EXECUTED SELCHN MACRO

A. SELECTING A CHANNEL

SELCHN N .

B. SETTING CHANNEL DATA BASE (NOTE: FOR EVERY SETXXX MACRO BELOW, THERE IS A CORRESPONDING SELXXX MACRO WITH IDENTICAL FORMAT ARGUMENTS FOR MODIFYING THE JOB STANDARD, CHANNEL INDEPENDENT DATE BASE,)

SCRIPT EXTERNAL DOCUMENTATION

100-XXX-XXX-00

TONY LAUCK

2 MAY 70

THE INFORMATION IN THIS MEMORANDUM IS SUBJECT TO CHANGE WITHOUT NOTICE AND SHOULD NOT BE CONSTRUED AS A COMMITMENT BY DIGITAL EQUIPMENT CORPORATION.

THE PROGRAM DESCRIBED IN THIS MEMORANDUM WAS DEVELOPED TO AID THE STUDY OF THE POP-10 MONITOR, IT IS NOT A SUPPORTED PRODUCT, BUT IS AVAILABLE TO CUSTOMERS ON A FOR INFORMATION PURPOSES ONLY BASIS.

1.8 PURPOSE

THE SCRIPT PROGRAM ALLOWS PREDETERMINED SEQUENCES OF CHARACTERS TO BE SENT OVER MULTIPLE PSEUDO-TELETYPES AND THEREBY ALLOW THE SIMULATION OF A LOAD ON THE TIME-SHARING SYSTEM, THE RESULTS OF A RUN CAN BE WATCHED ON-LINE AND STATISTICS OF RESPONSE TIME, ETC. CAN BE RECORDED ON THE SYSTEM DISK.

2.0 JOB CAPABILITY

THE SCRIPT PROGRAM HAS BEEN WRITTEN AS A REENTRANT PROGRAM, THE CODE AND TEXT TO BE SENT ARE IN THE HIGH SEGMENT AND CAN BE SHARED BY SEVERAL JOBS, EACH WITH A 1K LOW SEGMENT, EACH JOB CAN CONTROL UP TO 14 JOBS, SO IT BECOMES POSSIBLE TO SIMULATE A LARGE NUMBER OF PDP=18 TIME-SHARING USERS.

3.0 CONTROL FEATURES

THE SCRIPT IS LOADED INTO THE HIGH SEGMENT FROM ANY POP-18 INPUT DEVICE. IN ADDITION TO THE TEXT TO BE SENT, CONTROL COMMANDS CAN BE INCLUDED TO DETERMINE THE SPEED AT WHICH THE SIMULATED USERS WILL OPERATE.

3.1 TIMING PARAMETERS

PARAMETERS SUBJECT TO VARIATION INCLUDE TYPE-IN TIME, TYPE-OUT TIME, AND USER "THINK" TIME. THE TYPE-IN AND TYPE-OUT TIME CAN BE SPECIFIED AS A CONSTANT OR AS A RATE, IN MHICH CASE THE TIME HOULD DEPEND ON THE NUMBER OF CHARACTERS SENT OR RECEIVED, THE "THINK" TIME IS BROKEN UP INTO THO PARTS: 1) THE ALLOHED RESPONSE TIME, AND 2) "FREE" TIME, IF THE COMPUTER GIVES INSTANTANEOUS RESPONSE TO A COMMAND, THE TOTAL DELAY IS SIMPLY THE SUM OF THE THO GUANTITIES. IF RESPONSE IS GREATER THAN ALLOHED, "THINK" TIME IS EQUAL TO THE "FREE" TIME, IN BETHEEN, "THINK" TIME IS THE SUM OF ALLOWED RESPONSE PLUS "FREE" TIME MINUS THE ACTUAL COMPUTER RESPONSE TO THE COMMAND, ONE ADDITIONAL TIME FACTOR ALLOHED IS THE ABILITY TO SET A MAXIMUM RESPONSE TO TYPE-OUT DELAY FOR A GIVEN COMMAND, IF THE COMMAND EXCEEDS THIS LIMIT, THEN THE JOB IS INTERRUPTED BY SENDING EXCEEDS THIS LIMIT, THEN THE JOB IS INTERRUPTED BY SENDING THO CONTROL C CHARACTERS OVER THE PSEUDO TELETYPE. THIS ALLOWS A SCRIPT TO INCLUDE PROGRAM LOOPS WHICH ARE INTERRUPTED AFTER A SPECIFIED TIME INTERVAL.

3.2 REPETITION OF SCRIPTS

ÀN ADDITIONAL SCRIPT LANGUAGE FEATURE ALLONS THE SCRIPT TO SPECIFY HOW MANY TIMES IT WILL BE EXECUTED, SO THAT STEADY STATE LOADING CONDITIONS CAN BE MEASURED.

3,3 STAGGERING LOAD BUILDUP

WHEN MULTIPLE JOBS ARE TO FOLLOW THE SCRIPT, THE SCRIPT MAY SPECIFY A STAGGERING INTERVAL SO THAT LOAD BUILDUP CAN BE GRADUAL.

3.4 MULTIPLE USER NUMBERS

AS AN OPTIONAL FEATURE, THE SCRIPT PROGRAM WILL CONVERT THE "#" CHARACTER INTO AN OCTAL STRING EQUAL TO THE PTY UNIT NUMBER, THIS WILL ALLOW ONE SCRIPT TO LOG MANY JOBS IN UNDER DIFFERENT NUMBERS OR FOR MULTIPLE JOBS TO USE SEPERATE FILES.

4.0 LOGGING OF RESULTS

THE SCRIPT PROGRAM MAKES AN ENTRY IN THE LOG FILE FOR EACH LINE OF PTY DATA SENT TO THE TIME-SHARING SYSTEM. THE TIME, IDENTITY OF A PARTICULAR JOB, NUMBER OF CHARACTERS SENT, NUMBER OF CHARACTERS RECEIVED, NUMBER OF BUFFERS RECEIVED, AND TOTAL RESPONSE TIME ARE ALL RECORDED, IN ADDITION, DELAYS IN SENDING OR SIMULATING TELETYPE OUTPUT DUE TO POOR SCRIPT PROGRAM RESPONSE ARE ALSO RECORDED. THIS PROVIDES SOME IDEA OF HOW THE RESPONSE TO THE CONTROLLING JOB AFFECTED SYSTEM LOAD AND RESPONSE TIME MEASUREMENTS, IDEALLY THE CONTROLLING JOB WOULD BE REAL-TIME, E.G. HIGH PRIORITY AND LOCKED IN CORE. DELAYS TO THE SCRIPT INPUT/OUTPUT LIGHTEN THE OVERAL SYSTEM LOAD, WHILE DELAYS IN RECEIVING REQUESTS FOR MORE INPUT ARE MEASURED AS IF THE USER JOB HAD EXPERIENCED HORSE RESPONSE THAN IT ACTUALLY DID.

AS A FURTHER CHECK ON ERRORS IN RESPONSE TIME MEASUREMENTS DUE TO POOR SCRIPT PROGRAM RESPONSE, A "+" CHARACTER IS OUTPUT WHEN POOR SCRIPT PROGRAM RESPONSE MAY HAVE CAUSED THE PT WAKE FUNCTION IN THE MONITOR TO FAIL, WHEN THIS HAPPENS, THE SCRIPT PROGRAM WILL WAKE UP BASED ON ITS SLEEP INTERVAL AND NOT ON OBJECT JOB RESPONSE, NORMALLY, THE MONITOR RESETS THE SLEEP COUNT WHEN A JOB RUNNING ON A PSEUDO-TELETYPE NEEDS SERVICE, THE SCRIPT PROGRAM TESTS THE PTY FLAGS, AND IF THE PTY DOESN'T NEED SERVICE SLEEP, IDEALLY, THIS SLEEP WILL BE TERMINATED IMMEDIATELY BY THE MONITOR, HOWEVER, SHOULD THE SCRIPT PROGRAM BE RESCHEDULED BETWEEN TESTING THE PTY AND DOING THE SLEEP, THIS CAN'T HAPPEN, IN THIS CASE, THE SCRIPT PROGRAM COULD SLEEP FOR ITS MAXIMUM INTERVAL. THIS COULD BE UP TO 5 SECONDS. UNFORTUNATELY, THERE IS NO WAY TO TELL IF THIS HAPPENED. THE "+" IS SET WHENEVER A JOB GETS RESPONSE AND THE TIME OF DAY EXCEEDED THE TIME OF DAY THE SLEEP ENTRY WOULD HAVE TERMINATED. THIS CAN OCCUR ALSO DUE TO POOR RESPONSE ONCE THE SLEEP INTERVAL HAS TERMINATED.

THE RESPONSE TIME MEASURED IS THE TOTAL TIME FROM OUTPUTTING ("TYPING") A LINE OVER THE PTY UNTIL THE PROGRAM REQUESTS THE NEXT LINE OR TIMES OUT TO TWO CONTROL-C CHARACTERS, LESS TIME SPENT SIMULATING TTY OUTPUT. THUS, IF ONE LINE TO THE SYSTEM PRODUCES 50 LINES OF OUTPUT, ONE RESPONSE TIME WILL BE RECORDED, WHICH IS THE TOTAL TIME THE USER WAS WAITING FOR THE COMPUTER.

4,2 OVERLAP AND ITS EFFECT ON RESPONSE TIME MEASUREMENTS

THERE IS ONE POSSIBLE DIFFICULTY: OVERLAP BETHEEN OUTPUT AND THE NEXT INPUT, NORMALLY AN OUTPUT-BOUND PROGRAM IS WOKEN UP WHEN 8 CHARACTERS OF SPACE REMAIN IN THE MONITOR BUFFER, THUS A Ø.8 SECOND DELAY (AT 10 CHARACTERS/SEC) WOULD NOT CAUSE A PAUSE IN TYPE-OUT. UNFORTUNATELY, THE PTY TRANSFERS A LÎNE AT A TIME, SO THIS OVERLAPPED TIME IS LOST. THE NET AFFECT IS TO MAKE THE MEASURED RESPONSE TIMES LOOK A LITTLE WORSE THAN RESPONSE TIMES AN ACTUAL TTY USER WOULD SEE, INCIDENTALLY, SHOULD THE PROGRAM REQUEST. INPUT WHILE TYPEOUT IS ÎN PROGRESS, ALL TYPEOUT DELAY WILL BE COMPLETED BEFORE ACTING ON THE INPUT REQUEST.

4.3 DIFFERENT BUFFERING MODES

IF THE SCRIPT SPECIFIED OUTPUT AS A FUNCTION OF TIME, THEN THE SCRIPT PROGRAM WAITS UNTIL THE DELAY IS UP, THEN DATA IS TRANSFERRED OVER THE PTY TO THE SCRIPT PROGRAM, WHEN THE SCRIPT SPECIFIES AN OUTPUT RATE, THE SCRIPT PROGRAM MUST FIRST READ THE DATA FROM THE PTY, DETERMINE THE DELAY, AND THEN SLEEP, SPECIFYING ONE MODE OR THE OTHER MAY BE APPROPRIATE TO PARTICULAR PROGRAMS DUE TO DIFFERENT BUFFERING MODES.

4.4 ANALYSIS OF RESPONSE TIME RESULTS

IN ANY EVENT, THE USER MUST ANALYZE RESPONSE-TIME RESULTS WITH A KNOWLEDGE OF THESE FACTORS, AND AN UNDERSTANDING OF THE OVERLAP BETHEN USER PROGRAM BUFFERS, MONITOR BUFFERS, AND SCRIPT BUFFERS, ALTERNATELY, IF PSYCHOLOGICAL SYSTEM PERFORMANCE IS IMPORTANT, THE USER CAN USE THE SYSTEM MANUALLY AND SEE HOW CLEVERLY THE SYSTEM IS CONCEALING ITS RESPONSE. THE MAIN PURPOSE OF THE SCRIPT PROGRAM IS TO OBTAIN CONSISTENT RELATIVE RESPONSE FIGURES TO ASSESS THE EFFECT OF HARDWARE AND SOFTWARE CHANGES IN THE TIME+SHARING SYSTEM,

5.0 FORMAT OF SCRIPT FILES

5.1 COMMAND LINES

A SCRIPT FILE CONSISTS OF SCRIPT LINES WHICH END HITH A CLINE FEED> CHARACTER, SCRIPT LINES ARE EITHER COMMAND LINES OR TEXT LINES, COMMAND LINES ARE USED TO CONTROL TYPING AND OPERATION OF THE SCRIPT PROGRAM, TEXT LINES ARE SENT OVER THE PSEUDO TELETYPE TO RUN THE OBJECT JOBS.

5,2 TEXT LINES

A COMMAND LINE BEGINS WITH ONE EXCLAMATION POINT WHICH IS FOLLOWED BY A NON-EXCLAMATION POINT CHARACTER,

A TEXT LINE BEGINS WITH NO EXCLAMATION POINT, OR WITH THO EXCLAMATION POINTS. IN THIS CASE, ONLY THE SECOND IS SENT TO THE OBJECT JOB, IF A SCRIPT LINE BEGINS WITH ONE UP-ARROW, THEN THE UP-ARROW IS NOT SENT; INSTEAD THE NEXT CHARACTER IS CONVERTED TO A CONTROL CHARACTER BY COMPLEMENTING BIT 100, TWO UP-ARROWS RESULT IN ONE UP-ARROW BEING SENT. (THE CR/LF AT THE END OF ANY LINE STARTING WITH A SINGLE UP-ARROW ARE NOT SENT.)

NOTE THAT "!" AND "+" HAVE NO SIGNIFICANCE EXCEPT AT THE BEGINNING OF A TEXT OR COMMAND LINE,

5.3 COMMAND LINE SYNTAX

COMMAND LINES CONSIST OF NUMBERS AND LETTER SWITCHES. SWITCHES THAT TAKE NUMERICAL VALUES MAY BE PRECEDED BY A NUMBER. A NUMBER CONSISTS OF POSSIBLY ONE MINUS SIGN FOLLOWED BY A STRING OF DECIMAL DIGITS. THERE CAN BE NO SPACES OR TABS BETWEEN THE START AND END OF A NUMBER. AT OTHER POINTS, SPACES AND TABS ARE IGNORED IN COMMAND LINES.

SHOULD A NUMBER NOT BE SPECIFIED, THE LAST NUMBER SUPPLIED IS ASSUMED. IF NO VALUE HAS BEEN SUPPLIED, A ZERO IS ASSUMED AT THE START OF EACH COMMAND LINE.

CERTAIN LETTER SWITCHES MAY NOT HAVE NUMBERS ASSOCIATED WITH THEM. THESE SWITCHES MAY NOT BE PRECEDED BY A NUMBER UNLESS THERE IS AN INTERVENING LETTER SWITCH THAT ALLOWS A NUMBER,

ILLEGAL CHARACTERS OR BAD SYNTAX RESULT IN AN ERROR WHEN PROCESSING JOBS. THESE ERRORS ARE NOT DETECTED WHEN THE SCRIPT IS LOADED INTO THE HIGH SEGMENT,

A COMMAND LINE MAY INCLUDE A COMMENT BY USING A SEMICOLON. THE SEMICOLON AND ANY CHARACTERS REMAINING ON THE COMMAND LINE ARE DELETED WHEN THE SCRIPT IS LOADED AND SO USE NO CORE AT RUN-TIME.

A COMMAND LINE MUST NOT END WITH A NUMBER, THUS A LETTER SWITCH MUST FOLLOW ANY NUMBER IN A COMMAND LINE,

5.4 LETTER SWITCHES

- I IF NON-NEGATIVE ARGUMENT SUPPLIED -- SETS TYPE-IN
 DELAY

 IF
 - NEGATIVE ARGUMENT SUPPLIED -- SETS TYPE-IN RATE.
- O SAME AS I EXCEPT THAT IT SETS TYPE-OUT RATE.
- R 1F NON-NEGATIVE ARGUMENT SUPPLIED -- SETS ALLOWED RESPONSE TIME
- F IF NON-NEGATIVE ARGUMENT SUPPLIED -- SETS FREE TIME
- S IF NON-NEGATIVE ARGUMENT SUPPLIED -- SETS STAGGER TIME
- T IF POSITIVE ARGUMENT SUPPLIED -- SETS NUMBER OF TIMES TO DO SCRIPT,
- C IF A POSITIVE ARGUMENT SUPPLIED -- SETS MAXIMUM DELAY BEFORE PROGRAM SENDS *C+C
 - ZERO ARGUMENT SUPPLIED -- INHIBITS SENDING
- L NO ARGUMENTS ALLOHED -- SETS L MODE FLAG
- N NO ARGUMENTS ALLOWED -- CLEARS L MODE FLAG
- U NO ARGUMENTS ALLOWED -- SETS U MODE FLAG
- V NO ARGUMENTS ALLOWED -- CLEARS U MODE FLAG

5,5 TIMING UNITS

TIMES ARE IN MILLISECONDS. RATES ARE IN MILLISECONDS PER CHARACTER.

5.6 L MODE

WHEN L MODE IS SET <CR> AND <LF> WILL NOT BE SENT OVER THE PTY. THUS A LINE ENDING WITH <ALTMODE> CAN BE SENT. ANY LINE MUST END HOWEVER WITH A FULL CHARACTER SET BREAK CHARACTER DUE TO A LIMITATION IN THE PTY.

5,7 U MODE,

WHEN SET U MODE CONVERTS "*" IN TEXT LINES INTO A STRING OF TWO OCTAL DIGITS EQUAL TO THE PTY UNIT NUMBER. (LEADING ZEROS WILL BE INCLUDED.) ALL DEC SCRIPTS USE THIS FEATURE TO LOG IN THE JOB UNDER PPN 4,77700 THROUGH 4,77777 (I.E., 4,777*).

6.0 OPERATING INSTRUCTIONS

6.1

BUILD A TIME-SHARING SYSTEM WITH SUFFICIENT JOBS AND PSEUDO-TELETYPES. ONE CONTROL JOB WILL BE NEEDED FOR EACH 14 JOBS FOLLOWING THE SCRIPT.

6,2

CREATE AN APPROPRIATE SCRIPT.

6,3

START THE SCRIPT PROGRAM.

4 4

WHEN IT ASKS IF A SCRIPT IS TO BE LOADED. TYPE "YES (CR)",

6.5

TYPE THE DEVICE, FILE NAME, AND EXTENSION. IF ARGUMENTS ARE NOT SUPPLIED, THEY DEFAULT TO DSKISCRIPT.

6.6

THE PROGRAM WILL RESPOND WITH "LOADED!", IF THERE WERE ERRORS IT WILL ASK INSTEAD IF A SCRIPT IS TO BE LOADED, GO BACK TO STEP 6.4.

6.7

IF THE SCRIPT IS NOT GOING TO BE SHARED GO TO STEP 6,10,

6.8

RETURN TO MONITOR MODE AND SAVE THE LOADED SCRIPT WITH A SSAVE COMMAND. EXAMPLE: "SSAVE DSK SCRIPT <CR>".

6.9

START N COPIES OF THE PROGRAM BY LOGGING IN N JOBS AND GIVING THE COMMAND "RUN DSK SCRIPT" OR WHAT EVER IS NEEDED TO LOAD THE SAVED VERSION FROM STEP 6.8, EACH JOB WILL ASK IF A SCRIPT IS TO BE LOADED, ANSWER "NOCCR>". THE INSTRUCTIONS IN THE REMAINING STEPS SHOULD BE FOLLOWED FOR EACH OF THE N JOBS.

6.10

THE PROGRAM WILL NOW ASK HOW MANY JOBS ARE TO BE RUN. ENTER THE NUMBER FOR EACH CONTROL JOB ON ITS TTY. THE MAXMIMUM NUMBER IS 14 JOBS PER CONTROL JOB, EACH OBJECT JOB NEEDS A

6.11

THE PTY NAMES WILL BE TYPED OUT AS THEY ARE INITED BY EACH SCRIPT JOB, SHOULD THERE BE TOO FEW, THEN THE SCRIPT PROGRAM WILL RELEASE ALL GOTTEN SO FAR AND ASK OVER AGAIN HOW MANY JOBS ARE TO BE RUN.

6,12

THE FIRST JOB RUN BY A GIVEN SCRIPT JOB CAN BE MONITORED ON DEVICE TTY. THIS IS USEFUL FOR DEBUGGING A NEW SCRIPT, ANSWER THE QUESTION "DO YOU WANT TO WATCH FIRST JOB ON TTY?" APPROPRIATELY. INCIDENTALLY, IF DEVICE TTY HAS BEEN ASSIGNED TO A DIRECTORY DEVICE, THIS OUTPUT WILL BE GIVEN THE FILE NAME "MONITAR". SHOULD THE DEVICE BE UNAVAILABLE, OR THE FILE UNENTERABLE, AN ERROR MESSAGE WILL APPEAR ON THE TELETYPE AND THE QUESTION WILL BE ASKED AGAIN.

SHOULD AN ERROR OCCUR ON DEVICE TTY WHILE RUNNING. THE RUN Will not be suspended. However, subsequent monitoring will BE INHIBITED.

6,13

IF THE SCRIPT CALLS FOR FASTER OUTPUT THAN DEVICE TTY CAN HANDLE, THEN THE SCRIPT JOB WILL GO INTO I/O WAIT, THIS WILL RESULT IN VERY LONG DELAY TIMES ATTRIBUTED TO THE SCRIPT PROGRAM. THIS CONDITION SHOULD BE AVOIDED BY CHANGING THE SCRIPT PARAMETERS, USING A FASTER DEVICE TTY OR NOT MONITORING AT ALL.

6.14

THE PROGRAM WILL NOW ASK, "DO YOU WANT RESPONSE TIMES LOGGED?" A "NO<CR>" ANSWER WILL CAUSE THE SCRIPT TO BEGIN, IN THIS CASE, GO TO STEP 6.16.

IF THE QUESTION WAS ANSWERED "YES<CR>", THE PROGRAM WILL ASKED FOR A DEVICE, FILE NAME AND EXTENSION. ARGUMENTS NOT SUPPLIED WILL DEFAULT TO DSK:LOGFIL.

IF THE DEVICE IS NOT AVAILABLE, OR IF THE FILE CAN NOT BE ENTERED, GO BACK TO STEP 6.14.

SHOULD A DATA ERROR OCCUR WHILE RUNNING, THE RUN WILL PROCEED WITH SUBSEQUENT LOGGING INHIBITED. AN ERROR MESSAGE WILL APPEAR ON THE TELETYPE.

6.16

JOBS UNDER CONTROL OF A GIVEN CONTROL PROGRAM WILL BE STAGGERED BY AN INTERVAL SPECIFIED IN THE SCRIPT, IF MULTIPLE SCRIPT JOBS ARE RUNNING, THE USER CAN STAGGER THEIR TIMING BY ENDING STEP 5.14 OR 6.15 AT THE APPROPRIATE TIME OF DAY.

6.17

WHEN THE LAST JOB UNDER A GIVEN SCRIPT PROGRAM HAS FINISHED, THE MESSAGE "ALL JOBS DONE!" WILL APPEAR ON THE USERS TELETYPE AND THE LOG FILE AND MONITOR FILE WILL BE CLOSED, THE PROGRAM WILL THEN EXIT.

NOTE THAT IF MULTIPLE JOBS ARE RUNNING THE FIRST JOB MAY WELL BE OVER A LONG TIME BEFORE THE LAST. THIS IS THE JOB MONITORED ON DEVICE TTY.

6.18

SHOULD IT BE NECESSARY TO TERMINATE A RUN, STOP THE CONTROL PROGRAM BY TYPING TWO CONTROL C> CHARACTERS, TO CLOSE OUT THE LOG FILE REENTER THE PROGRAM BY A REENTER COMMAND, A MESSAGE "JOBS ABORTED!" WILL APPEAR ON THE TELETYPE.

IN CASE THIS IS DONE, BE AWARE THAT ANY JOBS RUNNING UNDER SCRIPT PROGRAM CONTROL WILL NOW BE DETACHED. THE USER SHOULD KILL THESE JOBS OFF OR DO A 143 MONITOR RESTART TO FLUSH ALL JOBS.

6,19

THE FORTRAN PROGRAM TOTAL CAN BE USED TO SUMMARIZE THE RESPONSE LOG FILE. IT TAKES INPUT FROM 1:FORØ1.DAT AND PLACES A SHORT LISTING ON 6:FORØ6.DAT.

DMPFIL IS A FILE DUMP PROGRAM; IT READS À FILE AND PREPARES A PRINTABLE VERSION OF AN OCTAL DUMP OF THE FILE. IT WILL ALSO DUMP A DECTAPE BLOCK BY BLOCK, OR DUMP A SAVE FILE AS A CORE DUMP, OR A DISK FILE STRUCTURE BLOCK BY BLOCK.

ASSEMBLY INSTRUCTIONS:

.COMPILE DMPFIL

THERE ARE NO ASSEMBLY OPTIONS

RUN INSTRUCTIONS:

R DMPFIL +<OUTPUT FILE>+<INPUT FILE>/SWITCHES

SWITCHESI

NNNNNND - DUMP DECTAPE, BEGINNING AT BLOCK NNNNNN (OCTAL)
INCLUDES LISTING OF DIRECTORY

NNNNNNK - ASSUME FILE IS SAVE FILE, DUMP AS CORE DUMP, BEGINNING AT LOC NNNNNN NNNNNN - ASSUME FILE IS HIGH SEGMENT SAVE FILE, DUMP AS CORE DUMP

NNNNNNS - DUMP DÍSK, BEGINNING AT BLOCK NNNNNN(OCTAL), USING SUPER USETI

NNNNNT - STOP DUMP AT NNNNNN(OCTAL)

DEFAULT OUTPUT FILE IS LPT: .LST

DEFAULT INPUT FILE IS DSK!

DEFAULT IS THE SAME FILE ON BOTH SIDES

IF NO "+", INPUT FILE IS SPECIFIED

"=" CAN BE USED FOR "+"

REENTER WILL CLOSE THE FILES.
